

Aakia tuerckheimii (Hack.) J.R.Grande. *Phytoneuron* 22:2 (2014).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Guatemala. **Basionym or Replaced Name:** *Panicum tuerckheimii* Hack., *Allg. Bot. Syst.* 12:60 (1906). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *H. von Tuerckheim II 820 [8618]*, 1903, Guatemala: Alta Verapaz: Cubilquitz im Hochwald (W; IT: NY-232347 (fragm.), US-81303 (fragm. ex W), US-973891, US-973890).

Illustrations (Journals): *Taxon* (63 (2): 270 (2014)).

Derivation (Clifford & Bostock 2007): in honor of Hans von Tuerckheim (1853–1920) German botanist.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Panicinae.

Habit, Vegetative Morphology. Perennial. Rootstock evident. Culms erect or geniculately ascending, 30–50 cm long. Culm-internodes elliptical in section, distally glabrous. Culm-nodes pubescent. Lateral branches lacking. Leaf-sheaths keeled, glabrous on surface. Ligule a ciliate membrane, 0.5 mm long. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 10–25 cm long, 20–25 mm wide. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 15–20 cm long. Primary panicle branches ascending, 5–10 cm long. Panicle axis glabrous. Panicle branches glabrous, pubescent in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, acuminate, 2.5–3 mm long, 0.9 mm wide, falling entire.

Glumes. Glumes dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 0.05–0.1 length of spikelet, hyaline, without keels, 0 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume elliptic, 1 length of spikelet, membranous, dark brown, without keels. Upper glume lateral veins obscure. Upper glume surface puberulous. Upper glume apex acuminate.

Florets. Basal sterile florets 1, barren, with palea or without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of spikelet, membranous, light brown, obscurely veined, puberulous, acuminate. Fertile lemma elliptic, dorsally compressed, 2.4 mm long, 0.8 mm wide, coriaceous, without keel. Lemma margins involute. Lemma apex acute, pubescent. Palea involute, coriaceous.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Central Mexico, Gulf (Mexico), Southeast Mexico. **Mesoamerica.** Belize, Guatemala.

Puebla. Veracruz. Chiapas.

Achlaena piptostachya Griseb. *Cat. Pl. Cub.* 229 (1866).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Arthropogon*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *C. Wright 3487*, Cuba (NY-71022, US-927103, US-75310 (fragm.)).

Recent Synonyms: *Arthropogon piptostachyus* (Griseb.) Pilger, *Rev. Mus. Paulista* 13: 1250 (1922).

Illustrations (Books): A.S.Hitchcock, *Manual of the Grasses of the West Indies* (1936) (158, Fig. 100).

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012)

(Pl. 11).

Derivation (Clifford & Bostock 2007): Gk. *pipto*, fall down; *stachys*, ear of corn. Spikelets deciduous.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths thickened and forming a bulb. Culms 30–75 cm long. Culm-nodes glabrous. Leaves mostly basal. Ligule a ciliolate membrane, 0.5–1 mm long. Leaf-blades linear or lanceolate, 10–30 cm long, 2–6 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 7–10 cm long, 4–7 cm wide, contracted about primary branches. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 6–7 mm long, falling entire. Spikelet callus linear, 2 mm long, pilose. Spikelet callus hairs 0.33 length of spikelet.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume subulate, 10–35 mm long. Upper glume oblong, 1 length of spikelet, coriaceous, without keels, 5–7 -veined. Upper glume surface scabrous. Upper glume awned, 1 -awned, awn 10–35 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, oblong, 1 length of spikelet, coriaceous, 5–7 -veined, scabrous, rough above, obtuse. Fertile lemma linear, membranous, without keel, 3 -veined, 0–3 -veined. Lemma apex obtuse. Palea hyaline, without keels.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 2. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba, Jamaica.

Achnatherum acutum (Swallen) Valdis-Reyna & Barkworth. *Contr. U.S. Natl. Herb.* 48: 15 (2003).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from Mexico. **Basionym or Replaced Name:** *Stipa acuta* Swallen, *Journ. Wash. Acad. Sc.* 30 (5): 212 (1940). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *F. Shreve* 8545, 1 Sep 1938, Mexico: Coahuila (US-1760238).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. acuo*, sharpen. Spikelets acute to acuminate.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, slender, 95 cm long. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface. Ligule an eciliate membrane, 1.5–2 mm long, lacerate, acute. Leaf-blades involute, 10–23 cm long, 1–2 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 15–20 cm long. Primary panicle branches ascending or spreading, 3–6 cm long. Panicle branches flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–5 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 11–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 11–12 mm long, 1.1–1.2 length of upper glume, hyaline, purple, without keels, 3 -veined. Lower glume lateral veins with cross-veins. Lower glume apex acute. Upper glume lanceolate, 9–10 mm long, hyaline, purple, without keels, 5–7 -veined. Upper glume lateral veins with cross-veins. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 7 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 45–50 mm long overall, with 30–35 mm long limb, with twisted column.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Northeast Mexico. Coahuila.

Achnatherum altum (Swallen) P.S. Hoge & M.E. Barkworth. *Phytologia*, 74(1): 5 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. **Basionym or Replaced Name:** *Stipa alta* Swallen, *Proc. Biol. Soc. Wash.* 56: 79 (1943). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *C.H. Mueller 3261*, 10 Sep 1939, Mexico: Coahuila: Cuatro Ciénegas Mun. (US-2209361; IT: US-2871136 (fragm.)).

Illustrations (Books): G.E.Gibbs Russell et al, *Grasses of Southern Africa* (1990).

Derivation (Clifford & Bostock 2007): *altus* (L.) tall. Culms tall, relative to those of other members of the genus.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, robust, 136.8–233.99 cm long. Culm-internodes distally glabrous. Leaves basal and cauline. Leaf-sheaths smooth or scaberulous, glabrous on surface. Ligule 4–8 mm long on basal shoots. Leaf-blades flat or involute, 30–60 cm long, 3–7 mm wide, stiff. Leaf-blade surface scabrous. Leaf-blade margins scabrous. Leaf-blade apex attenuate, antrorsely scabrous.

Inflorescence. Panicle contracted, linear, 23.24–33.6 cm long, 1.24–1.8 cm wide, bearing few spikelets. Primary panicle branches appressed, 5–10 cm long, bearing 10–11 fertile spikelets on each lower branch. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets. Spikelets lanceolate, subterete, breaking up at maturity, disarticulating below each fertile floret. Spikelet callus straight, base acute. Floret callus pubescent, acute.

Glumes. Glumes persistent, similar, subequal in width, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–11 mm long, 1 length of upper glume, hyaline, 3 -veined. Upper glume lanceolate, 7–8 mm long, hyaline, 3 -veined. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear or lanceolate, subterete, 4–5 mm long, coriaceous, dark brown, without keel. Lemma surface pilose. Lemma margins covering most of palea. Lemma apex awned, 1–2 -awned. Principal lemma awn geniculate, 8–12 mm long overall, with twisted column. Palea 2 -veined, without keels.

Flower and Fruit. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Northeast Mexico.
Coahuila.

Achnatherum aridum (M.E. Jones) M.E. Barkworth. *Phytologia*, 74(1): 6 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa arida* M. E. Jones, *Proc. Calif. Acad. Ser.2.*, 5: 725. (1895). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *M.E. Jones 5377*, 4 Jun 1894, USA: Utah: Piute Co.: Marysville (?; IT: US-236787).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (132).

Derivation (Clifford & Bostock 2007): *aridus* L. dry. Growing in arid places.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 40–85 cm long. Culm-internodes distally glabrous. Culm-nodes glabrous or pubescent. Leaf-sheaths smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs pubescent. Ligule an eciliate membrane, 0.5–1 mm long. Leaf-blades flat or involute, 15–25 cm long, 1–2.5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 8–15 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 1.5 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, with lower wider than upper, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–15 mm long, 1.2–1.3 length of upper glume, hyaline, much thinner above, without keels, 3–5 -veined. Lower glume apex acuminate. Upper glume lanceolate, 7–12

mm long, 1.7–2 length of adjacent fertile lemma, hyaline, much thinner above, without keels, 3–5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 4–6 mm long, coriaceous, pallid, without keel, 5 -veined, more than 3-veined. Lemma surface asperulous, rough above, pubescent, hairy all along or below. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 40–70 mm long overall, with 30–50 mm long limb, with twisted column. Column of lemma awn 10–20 mm long, glabrous. Palea without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA, Southwestern USA, South-central USA. Colorado. Arizona, California, Nevada, Utah. Texas.

Achnatherum arnowiae (S.L.Welsh & N.D.Atwood) Barkworth. *Sida* 22(1): 496 (2006).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Oryzopsis*).

TYPE from USA. **Basionym or Replaced Name:** *Stipa arnowiae* S.L.Welsh & N.D.Atwood, *Utah Fl.*, ed. 3 :799 (2003). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: USA, Utah, Johnson Canyon: Welsh & O'Dell 28062 (BRY holo, NY, UT, UTC).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (140).

Derivation (Clifford & Bostock 2007): in honor of Lois Goodell Arnow (1921-) United States botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Butt sheaths persistent and investing base of culm. Culms erect, 15–75 cm long. Leaf-sheaths outer margin hairy. Leaf-sheath oral hairs lacking or ciliate. Ligule an eciliate membrane, 1–4 mm long. Leaf-blades involute, 2 mm wide. Leaf-blade surface smooth or scaberulous. Leaf-blade apex attenuate, simple or filiform.

Inflorescence. Inflorescence a panicle, exserted or embraced at base by subtending leaf. Panicle contracted, linear, 5–20 cm long, 0.5–2.8 cm wide. Primary panicle branches appressed or ascending, 0.5–2.5(–5) cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, dorsally compressed, 5.1–6.1 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.2–0.4 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 5.1–6.1 mm long, 1.2 length of upper glume, membranous, without keels, 3 -veined. Lower glume lateral veins prominent. Lower glume surface puberulous. Lower glume apex acuminate. Upper glume ovate, 4.3–5.2 mm long, 1.4–1.5 length of adjacent fertile lemma, membranous, without keels, 3 -veined. Upper glume lateral veins prominent. Upper glume surface puberulous. Upper glume apex acuminate.

Florets. Fertile lemma ovate, dorsally compressed, 2.9–3.7 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface hirsute, hairy on back or on veins. Lemma margins convolute, covering most of palea. Lemma hairs white, 2–3 mm long. Lemma apex awned, 1 -awned. Principal lemma awn straight, 3–4.4 mm long overall, deciduous. Palea coriaceous, 2 -veined, without keels.

Flower and Fruit. Anthers 3, 1 mm long.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southwestern USA. Utah.

Achnatherum botschantzevii Tsvelev. *Novosti Sist. Vyssh. Rast.*, 1 1: 4 (1974).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Kirgizstan. **Basionym or Replaced Name:** *Achnatherum botschantzevii* Tsvelev, *Novosti Sist. Vyssh. Rast.*, 1 1: 4 (1974). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Alai range, Karabulak: Bochantsev 113 (LE holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Victor Petrovic Botschantzev (1910-) Russian botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Cataphylls evident. Basal innovations extravaginal. Culms erect, 15–25 cm long. Culm-internodes smooth, distally glabrous. Leaves basal and cauline. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 0.2–0.3 mm long on basal shoots. Leaf-blades filiform, convolute, 0.4–0.6 mm wide. Leaf-blade surface scabrous, rough adaxially, pubescent, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 5–8 cm long. Primary panicle branches bearing 1–4 fertile spikelets on each lower branch. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5.5–6.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pilose, obtuse.

Glumes. Glumes persistent, similar, subequal in width, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, 3 -veined. Lower glume apex attenuate. Upper glume lanceolate, 5.5–6.5 mm long, membranous, without keels, 3 -veined. Upper glume apex attenuate.

Florets. Fertile lemma linear to lanceolate, subterete, 1.8–2.2 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, with lobes 0.3–0.5 mm long, awned, 1 -awned. Principal lemma awn from a sinus, bigeniculate, 20–25 mm long overall, with twisted column. Palea 2 -veined, without keels.

Flower and Fruit. Lodicules 3. Anthers 3, 1.7–2.3 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Middle Asia. Kirgizistan, Tadjikistan.

Achnatherum bracteatum (Swallen) Valdis-Reyna & Barkworth. *Contr. U.S. Natl. Herb.* 48: 15 (2003).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. **Basionym or Replaced Name:** *Stipa bracteata* Swallen, *Journ. Wash. Acad. Sc.* 30: 213 (1940). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *I.L. Wiggins 5153*, 4 Apr 1931, Mexico: Baja California: collected on grassy flats 25 miles north of Ensenada, Baja California (US-1721797).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. bractus*, bract; *-ata*, possessing. Panicle or inflorescence branches subtended by leafy bracts.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 75–135 cm long, 3 -noded. Culm-internodes distally pubescent (below nodes), with reflexed hairs. Leaf-sheaths pubescent. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane. Leaf-blades flat or involute, 25–40 cm long, 1–3 mm wide. Leaf-blade surface pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Peduncle tipped by a glumaceous appendage (4–6mm long). Panicle open, elliptic, 35–42 cm long. Primary panicle branches 4–10 cm long. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, curved, pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–11 mm long, 1.2 length of upper glume, hyaline, without keels, 3 -veined. Lower

glume apex acuminate. Upper glume lanceolate, 8–9 mm long, 1.4–1.5 length of adjacent fertile lemma, hyaline, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 5.5–6.5 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 10–24 mm long overall, with twisted column. Palea 2 -veined, without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Northwest Mexico.
Baja California.

Achnatherum breviaristatum Keng & P.C. Kuo. *Flora Tsinlingensis* 1(1): 151, 442, pl. 119 (1976).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa nomnov*), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Gansu: Minxian, ca. 2100 m, (HT: ?).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 281).

Derivation (Clifford & Bostock 2007): L., *brevis*, short; *arista*, bristle; *-ata*, possessing. Lemma shortly awned.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Cataphylls evident. Culms erect, 150 cm long, 2–3 -noded. Leaf-sheaths longer than adjacent culm internode, smooth or scaberulous, glabrous on surface. Ligule an eciliate membrane, 1.4 mm long. Leaf-blades linear, involute, 25–50 cm long, 2–4 mm wide. Leaf-blade surface pilose, hairy abaxially. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 30 cm long, 5 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–10 mm long, puberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 6–6.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets. Lower glume lanceolate, 6 mm long, 0.9 length of upper glume, membranous, much thinner on margins, purple, 1-keeled, 5–7 -veined. Lower glume apex acute. Upper glume lanceolate, 6.5 mm long, membranous, with hyaline margins, purple, 1-keeled, 5 -veined. Upper glume apex acute.

Florets. Fertile lemma lanceolate, subterete, 5 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma margins convolute, covering most of palea, ciliate. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight, 3–4 mm long overall. Palea 1 length of lemma, 2 -veined, without keels. Palea surface puberulous, hairy on back, hairy below.

Flower and Fruit. Lodicules 3. Anthers 3, 3.5–4 mm long, yellow, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China North-Central.
Gansu.

Achnatherum bromoides (L.) P.Beauv. *Ess. Agrostogr.* 20, [146], 147 (1812).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980) (as *Stipa*), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from France. **Basionym or Replaced Name:** *Agrostis bromoides* L., *Mant. Pl.* 30 (1767). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: France, Montpellier: *Gouan* in Herb. Linn. 84/4 (LINN holo).

Recent Synonyms: *Stipa bromoides* (L.) Dörf., *Herb. Norm., Cent.* 34: 129, No. 3386 (1897).

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 347).

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Resembling *Bromus*, usually with respect to the inflorescence.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Cataphylls evident. Rhizomes short, firm. Culms erect, 50–100 cm long. Leaves basal and cauline, differentiated into sheath and blade. Leaf-sheaths wider than blade at the collar, smooth, outer margin glabrous or hairy. Leaf-sheath auricles absent or erect. Ligule an eciliate membrane, 0.5 mm long, membranous, truncate. Leaf-blades filiform, convolute, 15–35 cm long, 0.5–1 mm wide. Leaf-blade surface glabrous or pubescent (minutely), hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or elliptic, loose to effuse, 15–30 cm long. Primary panicle branches appressed to ascending, naked below or bearing spikelets almost to the base. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, flattened, straight, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.2–0.3 mm long, bearded, obtuse.

Glumes. Glumes similar, subequal in width, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–11 mm long, 1 length of upper glume, membranous, 3 -veined (vains very prominent). Lower glume lateral veins without connecting veins or with cross-veins. Lower glume surface glabrous or puberulous. Lower glume apex acute to acuminate, mucronate. Upper glume lanceolate, 7–10 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, without keels, 3 -veined. Upper glume lateral veins without cross-veins or with cross-veins. Upper glume apex acute to acuminate.

Florets. Fertile lemma linear to lanceolate, subterete, 5.5–7 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface villous, hairy below. Lemma margins convolute, covering most of palea. Lemma apex lobed, 2 -fid, with a short cylindrical neck, awned, 1 -awned. Principal lemma awn apical, straight, 1.5–2.5 mm long overall, limb scaberulous. Palea lanceolate, 0.6–0.7 length of lemma, membranous, 2 -veined, without keels. Palea apex lobed.

Flower and Fruit. Lodicules 3. Anthers 3, 5 mm long. Stigmas 2. Caryopsis with adherent pericarp, fusiform.

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia.

Region. Middle Europe, Southwestern Europe, Southeastern Europe, Eastern Europe.

Country /Province /State. : Hungary. : Balears, Corsica, France, Portugal, Sardinia, Spain. : Albania, Bulgaria, Greece, Italy, Crete, Romania, Sicily, Turkey Europe, Yugoslavia. Krym, Ukraine. **Northern Africa.** Morocco. **Middle Asia, Caucasus, Western Asia.** Turkmenistan. Transcaucasus. Iran, Iraq.

Achnatherum calamagrostis (L.) Beauv. *Agrost.* 19. t. 6. f. 146 (1812).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Europe. **Basionym or Replaced Name:** *Stipa calamagrostis* (L.) Wahlenb., *Veg. Helv.* 23. (1813). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: [Europe] Scheuch. Gram. 146,.

Recent Synonyms: *Calamagrostis argentea* DC., *Fl. Fr.* 3: 25 (1805).

Illustrations: None found.

Images: R.Darke, *Ornamental Grasses* (2004);, R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);

Derivation (Clifford & Bostock 2007): Gk. *kalamos*, reed; *agrostis*, a type of grass.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Cataphylls evident. Culms robust, 60–120 cm long. Leaf-sheaths smooth, outer margin glabrous or hairy. Leaf-sheath oral hairs lacking or ciliate. Ligule an eciliate membrane, 0.3 mm long. Leaf-blades involute, 2–3 mm wide. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 15–30 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 8–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume lanceolate, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface glabrous or puberulous. Lower glume apex acute. Upper glume lanceolate, 8–9 mm long, membranous, without keels, 3 -veined. Upper glume surface glabrous or puberulous. Upper glume apex acute.

Florets. Fertile lemma lanceolate, subterete, 3–4 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface villous. Lemma margins convolute, covering most of palea. Lemma hairs 3–4 mm long. Lemma apex awned, 1 -awned. Principal lemma awn straight or curved, 10 mm long overall. Palea without keels.

Flower and Fruit. Lodicules 3. Anthers 3, 3.5–4 mm long. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform. Hilum linear.

$2n = 24$ (2 refs TROPICOS).

Distribution (TDWG). Continent. Europe.

Region. Northern Europe (*), Middle Europe, Southwestern Europe, Southeastern Europe.

Country /Province /State. : GB Aliens (Ryves et al). : Austria, Germany, Switzerland. : France, Spain. : Albania, Bulgaria, Greece, Italy, Romania, Yugoslavia.

Achnatherum capense (L.) P. Beauv. *Ess. Agrostogr.* 146: 167 (1812).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. **Basionym or Replaced Name:** *Milium capense* L., *Mantissa Plantarum* 75 (1771). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: "Habitat ad Cap. b. spei.", ; South Africa, Cape: Coll?.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From the Cape of Good Hope, South Africa.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms decumbent, 10–30 cm long. Ligule an eciliate membrane. Leaf-blades involute, 5–15 cm long, 1–1.5 mm wide, glaucous. Leaf-blade surface glabrous or pubescent, hairy adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle contracted, linear, 5–15 cm long, 1 cm wide. Primary panicle branches appressed, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 1 mm long, bearded, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–20 mm long, 1 length of upper glume, hyaline, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 10–20 mm long, 2 length of adjacent fertile lemma, hyaline, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 5–7 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma apex entire, surmounted by a ring of hairs, awned, 1 -awned. Principal lemma awn bigeniculate, twisted together, 60–70 mm long overall, with twisted column. Column of lemma awn 30 mm long, hirtellous. Palea elliptic, 0.4 length of lemma, 2 -veined, without keels.

Flower and Fruit. Lodicules 2, oblanceolate, membranous. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform. Hilum linear.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Western Cape.

Achnatherum caragana (Trin.) Nevski. *Trudy Bot. Inst. Akad. Nauk S.S.S.R., Ser. 1, Fl. Sist. Vyssh. Rast.* 4: 337–336 (1937).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960) (as *Stipa*), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. **Basionym or Replaced Name:** *Stipa caragana* Trin., *Mem. Acad. Imp. Sci. St.-Petersbourg, Ser. 6, Sci. Math.* 1(1): 74 (1830). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia: "V. ssp. e littore oriental. maris Caspici.", *Eichwald* (HT: LE).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): From Tjuk-Caragan peninsula which projects into the Caspian Sea.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 30–100 cm long. Ligule an eciliate membrane, 0.7–0.9 mm long. Leaf-blades filiform, convolute, 10–20 cm long, 1–3 mm wide, glaucous. Leaf-blade surface scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 15–25 cm long, with spikelets clustered towards branch tips. Primary panicle branches 7–14 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 4.2–6.3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, 0.3 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume elliptic, 1 length of upper glume, membranous, without keels, 1–3 -veined. Lower glume apex acute or acuminate. Upper glume elliptic, 4.2–6.3 mm long, membranous, without keels, 3 -veined. Upper glume apex acute or acuminate.

Florets. Fertile lemma elliptic, subterete, 3–4 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight or curved, 7–15 mm long overall, without a column or with a straight or slightly twisted column, deciduous. Palea 2 -veined, without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. Siberia, **Middle Asia, Caucasus, Western Asia, China, Russia.** Altay, West Siberia. Kazakhstan, Kirgizistan, Turkmenistan, Tadzhikistan, Uzbekistan. North Caucasus, Transcaucasus. Afghanistan, Iran, Turkey. Xinjiang. **Indian Subcontinent.** Pakistan.

Achnatherum chingii (Hitchcock) Keng.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*).

Basionym or Replaced Name: *Stipa chingii* Hitchcock, *Proc. Biol. Soc. Wash.* 43 :94. (1930).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 286).

Derivation (Clifford & Bostock 2007): In honor of Ching Ren-chang (1898–1986) Chinese botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, slender, 80 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 2–3 mm long. Leaf-blades flexuous, filiform, 15–20 cm long, 0.5–1 mm wide. Leaf-blade surface ribbed, scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 15–20 cm long, with spikelets clustered towards branch tips. Panicle branches capillary, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, without keels. Lower glume apex obtuse. Upper glume lanceolate, 7–9 mm long, membranous, without keels. Upper glume apex obtuse.

Florets. Fertile lemma lanceolate, subterete, 6 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy below. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn bigenulate, 13 mm long overall, with twisted column. Middle segment of lemma awn 4 mm long. Column of lemma awn 1 mm long, puberulous. Palea without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, China North-Central, Qinghai, Tibet.

Achnatherum constrictum (Hitchc.) Valdis-Reyna & Barkworth. *Contr. U.S. Natl. Herb.* 48: 15 (2003).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. **Basionym or Replaced Name:** *Stipa constricta* Hitchc., *Contrib. U. S. Nat. Herb.* 24: 244 (1925). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A.S. Hitchcock 6742, 6 Sep 1910–7 Sep 1910, Mexico: *Hidalgo* (US-993345).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. constringo*, bind together.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, 80 cm long, 4–6 -noded. Lateral branches sparse, arising from lower culm. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 2–3 mm long. Leaf-blades involute, 5–15 cm long, 1–2 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 10–20 cm long. Primary panicle branches ascending. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent (white), acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 25–40 mm long, membranous, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 14–16 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma hairs white. Lemma apex with a short cylindrical neck or surmounted by a ring of hairs, with this appendage 1.2–1.4 mm long, awned, 1 -awned. Principal lemma awn bigenulate, 20–25 mm long overall, with twisted column. Palea 2 -veined, without keels.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Central Mexico, Northeast Mexico, Gulf (Mexico), Southwest Mexico.

Mexico State. Hidalgo.

Achnatherum contractum (B.L. Johnson) M.E. Barkworth. *Phytologia*, 74(1): 6 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Oryzopsis*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Oryzopsis hymenoides* var. *contracta* B.L.Johnson, *Phytologia* 167: 428 (1989). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Wyoming: Freezeout Hills, Carbon County, *Elias Nelson 4850* (HT: (University of Wyoming Herb., US)).

Oryzopsis contracta (B. L. Johnson) Shechter, *Brittonia* 18: 342 (1967).

Muhlenbergia rigida (Kunth) Kunth, *Révis. Gramin.* 1: 63 (1829).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (140).

Derivation (Clifford & Bostock 2007): *L. contracted*. Inflorescence a narrow panicle.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 25–50 cm long. Ligule an eciliate membrane, 3–6 mm long. Leaf-blades filiform, involute, 4–20 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 6–20 cm long. Primary panicle branches appressed, 2-nate. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, dorsally compressed, 5.5–6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.8 mm long, pilose.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 5.5–6 mm long, 1 length of upper glume, membranous, without keels, 3–5 -veined. Lower glume surface glabrous or puberulous. Lower glume apex acuminate. Upper glume ovate, 5.5–6 mm long, 2 length of adjacent fertile lemma, membranous, without keels, 3–5 -veined. Upper glume surface glabrous or puberulous. Upper glume apex acuminate.

Florets. Fertile lemma ovate, dorsally compressed, 3 mm long, coriaceous, dark brown, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma hairs 0.5–1.5 mm long. Lemma apex dentate, 2-fid, with lobes 0.5 mm long, awned, 1-awned. Principal lemma awn from a sinus, curved, 7–8 mm long overall, deciduous.

Flower and Fruit. $2n = 48$ (FNA).

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA. Montana, Wyoming.

Achnatherum coronatum (Thurb.) M.E. Barkworth. *Phytologia*, 74(1): 6 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa coronata* Thurb. ex S. Wats., Bot. Calif. 2 287. (1880). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *H.N. Bolander s.n.*, Apr 1872, USA: California: San Diego Co.: in a canyon around springs on hillside near Julian City (US-745778). ST: *Parry & Lemmon 422*, USA: California: San Bernardino.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (128).

Images: R.Darke, *Ornamental Grasses* (2004);, R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);.

Derivation (Clifford & Bostock 2007): *L. corona*, crown; -*ata*, possessing. Lemma densely appressed-villous with the hairs projecting above the apex to form a pappus-like crown.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–200 cm long, 2–6 mm diam. Culm-internodes distally glabrous or pubescent. Leaf-sheaths smooth, outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 2 mm long. Leaf-blades flat or involute, 15–30 cm long, 3–7 mm wide. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, 20–50 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, curved, 1.5 mm long, pilose, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 20 mm long, 1.1–1.5 length of upper glume, membranous, without keels, 3–5 -veined. Lower glume apex acuminate. Upper glume lanceolate, 13–18 mm long, 2 length of adjacent fertile lemma, hyaline, without keels, 3–5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 7.5–9 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface villous. Lemma margins convolute, covering most of palea. Lemma hairs 2–4 mm long. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 35–50 mm long overall, with twisted column. Column of lemma awn 10 mm long. Palea 2 -veined, without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

$2n = 40$ (FNA).

Distribution (TDWG). Continent. North America.

Country /Province /State. Southwestern USA, Mexico. California.

Achnatherum curvifolium (Swallen) M.E. Barkworth. *Phytologia*, 74(1) 7 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa curvifolia* Swallen, *Journ. Wash. Acad. Sc.* 23: 456 (1933). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *H. Wilkens* 1660, 29 Apr 1932, USA: New Mexico: Eddy Co.: Guadalupe Mountains (US-1538063).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (134).

Derivation (Clifford & Bostock 2007): *L. curvus*, bent; *folium*, leaf. The leaf-blades become spirally coiled in senescence, or on drying.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Butt sheaths pubescent. Culms erect, 35 cm long. Leaves mostly basal. Ligule an eciliate membrane. Leaf-blades curved, filiform, involute, 10–15 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 7–8 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, much thinner above, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 10 mm long, hyaline, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 5.5 mm long, coriaceous, light brown, without keel, 5 -veined, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma hairs white. Lemma apex acute, awned, 1 -awned. Principal lemma awn geniculate or bigeniculate, 22–25 mm long overall, with twisted column. Column of lemma awn hirsute. Palea 2 -veined, without keels.

Flower and Fruit. Lodicules 3, 2 mm long. Anthers 3, 3–4 mm long. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. South-central USA, Mexico. New Mexico, Texas. Northeast Mexico. Chihuahua.

Achnatherum diegoense (Swallen) M.E. Barkworth. *Phytologia*, 74(1): 7 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa diegoensis*, *Journ. Wash. Acad. Sci.* 30 (5): 212, f. 2. 1940. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: F.F. Gander 5778, 23 May 1938, USA: California: San Diego Co. (US-1761177).

Illustrations (Books): M.E. Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (130).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From San Diego County, California, USA.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 70–100 cm long. Culm-internodes scaberulous, distally pubescent. Leaf-sheaths smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs lacking. Ligule an eciliate membrane, 1–2 mm long, truncate or obtuse. Leaf-blades flat or involute, 15–40 cm long, 2–4 mm wide. Leaf-blade surface scabrous, rough abaxially, pubescent, hairy adaxially. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 15–30 cm long. Primary panicle branches appressed. Panicle branches glabrous in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–10 mm long, 1.1 length of upper glume, hyaline, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 8–9 mm long, hyaline, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 6.5–7.5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pilose, with conspicuous apical hairs. Lemma margins convolute, covering most of palea. Lemma hairs 1–2 mm long. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 20–33 mm long overall, with twisted column. Column of lemma awn scabrous, glabrous. Palea without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southwestern USA, Mexico. California. Northwest Mexico. Baja California.

Achnatherum duthiei (Hook. f.) P.C. Kuo & S.L. Lu. *Fl. Reipubl. Popularis Sin.* 9(3): 322, pl. 80, f. 9–14 (1987).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online (as *Stipa*), U. Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from India. **Basionym or Replaced Name:** *Stipa duthiei* Hook. f. *Fl. Brit. India* 7(22): 232 (1897) [1896]. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India: Garwhal, 12–13,000 ft, *Duthie* 273 (HT: ?).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 281).

Derivation (Clifford & Bostock 2007): in honor of John Firminger Duthie (1845–1922) English botanist who collected in India.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 100–160 cm long. Ligule an eciliate membrane, obtuse. Leaf-blades flat or convolute, 30–45 cm long, 2–3 mm wide. Leaf-blade apex filiform.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 20–25 cm long. Primary panicle branches 4–7 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume lanceolate, 10–12 mm long, 1 length of upper glume, hyaline, pallid, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 10–12 mm long, hyaline, pallid, without keels, 5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 6–7 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15 mm long overall, with twisted column. Column of lemma awn pubescent. Palea 1 length of lemma, 2 -veined, without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, China North-Central, Qinghai, Tibet. **Indian Subcontinent.** Eastern Himalaya, Nepal.

Achnatherum editorum (E. Fourn.) Valdis-Reyna ex Barkworth. *Contr. U.S. Natl. Herb.* 48: 16 (2003).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. **Basionym or Replaced Name:** *Stipa editorum* Fourn. *Mex. Pl. Enum., Gram.* 75 (1886). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *W.F. von Karwinski 1009C*, Mexico: in valle edita inter La Noria del Viejo et La Miquiguana (LE; IT: US-866119 (fragm. ex P)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. editus*, high place. Of high places, that is growing on mountains.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths pubescent. Culms erect, 80–100 cm long. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 3–6 mm long. Leaf-blades flat or involute, 20–40 cm long, 2–3 mm wide. Leaf-blade surface glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 10–20 cm long. Primary panicle branches appressed, 5–10 cm long, naked below or bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent (white), acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, hyaline, without keels, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex attenuate. Upper glume lanceolate, 9 mm long, hyaline, without keels, 3 -veined. Upper glume lateral veins obscure. Upper glume apex attenuate.

Florets. Fertile lemma linear, subterete, 5–6 mm long, coriaceous, pallid, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma hairs white. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 30–40 mm long overall, with a straight or slightly twisted column. Palea 2 -veined, without keels.

Flower and Fruit. Lodicules 3. Anthers 3, anther tip penicillate. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Central Mexico, Northeast Mexico. Puebla. Coahuila, Neuvo Leon, Zacatecas.

Achnatherum eminens (Cav.) M.E. Barkworth. *Phytologia*, 74(1): 7 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. **Basionym or Replaced Name:** *Stipa eminiens* Icon. 5: 42, t. 467, f. 1. 1799. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Nie s.n.*, Mexico: Mixico: Chalma (MA; IT: US-866118 (fragm.)).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (132), R.McVaugh, *Flora Nova-Galiciana* Vol.14 *Gramineae* (1983) (as *Stipa*).

Derivation (Clifford & Bostock 2007): *L. emineo*, stand out. Conspicuous with respect to inflorescence.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, slender, 50–120 cm long, wiry. Culm-internodes distally glabrous. Leaf-sheaths smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 1.5–6 mm long. Leaf-blades flat or involute, 20–35 cm long, 1–2(–3) mm wide. Leaf-blade surface pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, nodding, 10–20 cm long. Primary panicle branches spreading, 3–4 -nate. Panicle branches capillary, bearded in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–1.5 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, with lower wider than upper, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–15 mm long, 1.1–1.3 length of upper glume, hyaline, much thinner above, without keels, 3–5 -veined. Lower glume apex acuminate. Upper glume lanceolate, 7–12 mm long, 1.5–1.7 length of adjacent fertile lemma, hyaline, much thinner above, without keels, 3–5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 4.5–7 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy all along. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 35–60 mm long overall, with twisted column. Column of lemma awn glabrous. Palea without keels.

Flower and Fruit. Lodicules 2. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

$2n = 44$ (FNA), or 46 (FNA).

Distribution (TDWG). Continent. North America.

Country /Province /State. **Southwestern USA, South-central USA, Mexico.** Arizona, California. New Mexico, Texas. Central Mexico, Northeast Mexico, Gulf (Mexico), Northwest Mexico, Southwest Mexico.

Distrito Federal, Mexico State, Puebla. Aguascalientes, Coahuila, Chihuahua, Durango, Guanajuato, Hidalgo, Neuvo Leon, Queretaro, San Luis Potosi, Tamaulipas, Zacatecas. Veracruz. Sonora. Jalisco, Nayarit, Oaxaca.

Achnatherum hendersonii Vasey. *Contrib. U. S. Nat. Herb.* 1. 267. (1893).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Oryzopsis*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Oryzopsis hendersonii*, *Contr. U.S. Natl. Herb.* 1(8): 267 (1893). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Henderson* 2249, 1892, USA: Washington: North Yakima, Clements Mountain.

Recent Synonyms: *Stipa hendersonii* (Vasey) Mehlenb., *Canad. J. Bot.* 49(9): 1568. 1971.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (138).

Derivation (Clifford & Bostock 2007): in honor of Louis Fourniquet Henderson (1853–1942) United States botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 10–30 cm long. Culm-internodes solid, antrorsely scabrous. Leaves mostly basal. Leaf-sheaths puberulous. Ligule an eciliate membrane, 0.5–1 mm long, pubescent on abaxial surface, truncate. Leaf-blades involute, 5–10 cm long, 0.5–1 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle, exerted or embraced at base by subtending leaf. Panicle open, lanceolate, 4–12 cm long, bearing few spikelets. Primary panicle branches appressed, 2–8 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, dorsally compressed, 3.8–6 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume oblong, 3.5–5.5 mm long, 0.9 length of upper glume, membranous, without keels, 5 -veined. Lower glume apex obtuse. Upper glume oblong, 3.8–6 mm long, 1 length of adjacent fertile lemma, membranous, without keels, 5 -veined. Upper glume lateral veins absent. Upper glume apex obtuse.

Florets. Fertile lemma oblong, dorsally compressed, 3.8–6 mm long, coriaceous, dark brown, without keel. Lemma surface glabrous. Lemma margins convolute, covering most of palea. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn 6–10 mm long overall, deciduous. Palea 1 length of lemma, coriaceous, 2 -veined, without keels.

Flower and Fruit. Lodicules 3. Anthers 2 mm long, purple.

$2n = 34$ (FNA).

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA. Oregon, Washington.

Achnatherum henryi (Rendle) S.M. Phillips & Z.L. Wu. *Novon* 15(3): 475. (2005).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online (as *Oryzopsis*), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Stipa henryi* Rendle, *J. Linn. Soc., Bot.* 36(254): 382 (1904). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *A. Henry* 5530, China: Sichuan: S. Wushan (K). LT designated by Phillips & Wu, *Novon* 15(3): 475 (2005). ST: *A. Henry* 3444, China: Hupeh: Ichang ST: *Faber 1160*, China (?).

Recent Synonyms: *Oryzopsis henryi* (Rendle) Keng, *Fl. Tsinlingensis*, 1(1): 145 (1976).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Augustine Henry (1857–1936) Irish physician and forester.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms 30–60 cm long. Ligule an eciliate membrane, 0.2 mm long. Leaf-blades flat or convolute, 15–30 cm long, 2–4 mm wide. Leaf-blade surface ribbed. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 30 cm long. Primary panicle branches appressed, 5–10 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 3.3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, 0.3 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex obtuse. Upper glume ovate, 3.3–3.5 mm long, membranous, without keels, 3 -veined. Upper glume apex obtuse.

Florets. Fertile lemma elliptic, subterete, 3 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface puberulous. Lemma margins convolute, covering most of palea. Lemma apex

dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight, 10 mm long overall, limb puberulous. Palea without keels.

Flower and Fruit. Lodicules 2, 0.5–0.75 mm long. Anthers 3, 2 mm long, anther tip smooth. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, China North-Central, China Southeast.

Achnatherum hirticulme (S.L. Hatch, Valdis-Reyna & Morden) Valdis-Reyna & Barkworth. *Contr. U.S. Natl. Herb.* 48: 16 (2003).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Valdis 5007*, 22 Aug 1983, Mexico: Nuevo Lesn: 8 mi E of San Roberto Jct. along Hwy. 58 on the road to Galeana, 24:40'N 100:14'W, 1890 m, *Pinus cembroides*, *Juniperus*, *Yucca carnerosana*, *Opuntia*, *Larrea tridentata*, *Dasyllirion*, *Condalia ericoides*, *Aristida curvifolia*, *Bouteloua curtipendula*, *B. gracilis*, *B. uniflora* (TAES; IT: ANSM, CHAPA, ENCB, MEXU, MO-3291427, NY, TEX, US-3037668).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. hirtus*, hairy; culmus, stem. Culm bases densely hirsute.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths not bulbous. Culms geniculately ascending, 30–60 cm long, wiry, 6–11 -noded. Culm-internodes distally hispid, with reflexed hairs. Culm-nodes glabrous. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 0.5–1 mm long. Leaf-blades straight or curved, 1.5–6 cm long, 1 mm wide. Leaf-blade surface pilose, hairy on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 8–16 cm long, 1–2 cm wide. Primary panicle branches ascending, 2–3 -nate, bearing 2–4 fertile spikelets on each lower branch. Panicle axis with lower internodes 1–4.2 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–13 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–10.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.7–1 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–8 mm long, 1.1–1.2 length of upper glume, chartaceous, much thinner on margins, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 6–8 mm long, membranous, with hyaline margins, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 3.5–5 mm long, coriaceous, light brown, without keel, 5 -veined, more than 3-veined. Lemma surface villous. Lemma margins convolute, covering most of palea. Lemma apex surmounted by a ring of hairs, with this appendage 0.7–1 mm long, awned, 1 -awned. Principal lemma awn bigeniculate, 29–50 mm long overall, with 11–27 mm long limb, with twisted column. Middle segment of lemma awn 10–13 mm long. Column of lemma awn 8–10 mm long. Palea 3–4 mm long, 2 -veined, without keels. Palea surface pilose, hairy on back.

Flower and Fruit. Lodicules 2, 1–1.2 mm long, veinless. Anthers 3, 2 mm long, brown. Stigmas 2. Caryopsis fusiform, 3–4 mm long, light brown. Embryo 0.25 length of caryopsis.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Northeast Mexico. Coahuila, Neuvo Leon.

Achnatherum hymenoides (Roem. & Schult.) M.E. Barkworth. *Phytologia*, 74(1): 7 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Oryzopsis*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa hymenoides* Roem. & Schult., *Systema Vegetabilium* 2: 339. 1817. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: T: *Bradbury s.n.*, USA: banks of the Missouri River.

Recent Synonyms: *Oryzopsis hymenoides* (Roem. & Schult.) Ricker ex Piper, *Contrib. U. S. Nat. Herb.* xi. 109 (1906).

Illustrations (Books): K.F.Best, et al, *Prairie Grasses* (1971) (167 as *Oryzopsis*), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (140), F.W.Gould, *The Grasses of Texas* (1975) (as *Oryzopsis hymenoides*).

Images: R.Darke, *Ornamental Grasses* (2004);, R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);.

Derivation (Clifford & Bostock 2007): Gk. *hymen*, membrane; *-oides*, resembling. Spikelets with papery glumes.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–70 cm long. Leaves basal and cauline. Ligule an eciliate membrane, 3–7 mm long, entire or lacerate. Leaf-blades filiform, involute, 10–30 cm long, 1–2 mm wide, coriaceous, stiff. Leaf-blade surface ribbed. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, obovate, effuse, 7–15 cm long. Primary panicle branches spreading, 2-nate, branching divaricately. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, curved, 7–30 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, dorsally compressed, 5–8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.8 mm long, pilose.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume ovate, 5–8 mm long, 1 length of upper glume, membranous, without keels, 3-veined. Lower glume surface glabrous or puberulous. Lower glume apex attenuate. Upper glume ovate, 5–8 mm long, 1.6–2 length of adjacent fertile lemma, membranous, without keels, 3-veined. Upper glume surface glabrous or puberulous. Upper glume apex attenuate.

Florets. Fertile lemma ovate, dorsally compressed, 3–4 mm long, coriaceous, dark brown to black, without keel, 5-veined, more than 3-veined. Lemma surface villous. Lemma margins convolute, covering most of palea. Lemma hairs white, 2–4 mm long. Lemma apex obtuse, awned, 1-awned. Principal lemma awn straight, 3–6 mm long overall, deciduous. Palea coriaceous, 2-veined, without keels.

Flower and Fruit. $2n = 46$ (FNA), or 48 (FNA).

Distribution (TDWG). **Continent.** Temperate Asia, North America.

Country /Province /State. **Western Asia.** Turkey. **Subarctic America, Western Canada, Northwest USA, North-central USA, Southwestern USA, South-central USA, Mexico.** Yukon. Northeast Mexico, Northwest Mexico.

Chihuahua. Baja California Sur.

Achnatherum inaequiglume Keng. *Fl. Tsinlingensis*, 1 (1): 443, 151 (1976).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006) (as *Stipa*).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Li Hsien: Wang 21668.

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 284).

Derivation (Clifford & Bostock 2007): L. *inaequualis*, unequal; *gluma*, husk. Glumes differing in length and/or shape.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–50 cm long, 0.8–1 mm diam., 2–3-noded. Leaf-sheaths glabrous on surface or puberulous. Ligule an eciliate membrane, 0.5–1 mm long, scarious, entire or erose, truncate. Leaf-blades filiform, involute, 4–12(–20) cm long, 1–2 mm wide. Leaf-blade surface glabrous or puberulous, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 7–13 cm long, 1 cm wide. Primary panicle branches ascending, 1.5–3 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 7–8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus 0.3 mm long, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets. Lower glume lanceolate, 7–8 mm long, 1.1–1.4 length of upper glume, membranous, pallid or light green, 1-keeled, 3 -veined. Lower glume primary vein scabrous. Lower glume apex acuminate. Upper glume lanceolate, 5–7 mm long, membranous, pallid or light green, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 3–4 mm long, membranous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins convergent above. Lemma surface hirsute, hairy above. Lemma margins convolute, covering most of palea. Lemma hairs 3 mm long. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–20 mm long overall, with a straight or slightly twisted column. Column of lemma awn 0.33–0.5 length of limb. Palea 1 length of lemma, 2 -veined, without keels. Palea surface puberulous, hairy on back.

Flower and Fruit. Anthers 3, 2–2.5 mm long, anther tip smooth. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, China North-Central. Gansu. Sichuan.

Achnatherum inebrians (Hance) Keng. *Rast. Tsentral. Azii* 4: 40 (1968).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Stipa inebrians* Hance, *Journ. Bot.* 14: 212 (1876). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Alachan Mts.: Hance 19204 (BM holo, K, LE).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 290).

Derivation (Clifford & Bostock 2007): *L. inebrio*, intoxicate. When grazed by cattle in Mongolia they exhibit symptoms of intoxication.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–60 cm long. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, truncate. Leaf-blades involute, 20 cm long, 4–6 mm wide. Leaf-blade surface ribbed, scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 12–18 cm long. Primary panicle branches 2.5–5 cm long, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–4 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 5 mm long, membranous, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 3 mm long, coriaceous, dark brown, without keel, 3 -veined, 0–3 -veined. Lemma surface pilose, with conspicuous apical hairs. Lemma margins convolute, covering most of palea. Lemma apex pubescent, awned, 1 -awned. Principal lemma awn geniculate, 10 mm long overall, with twisted column. Column of lemma awn puberulous. Palea 1 -veined, without keels.

Flower and Fruit. Anthers 3, anther tip penicillate. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. **China** and **Mongolia.** China South Central, Inner Mongolia, China North-Central, Qinghai, Tibet, Xinjiang. Mongolia.

Achnatherum jacquemontii (Jaubert & Spach) P.C. Kuo & S. L. Lu.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006) (as *Stipa*).

Basionym or Replaced Name: *Stipa jacquemontii* Jaub. & Spach, *Illustr.* 4: 60. (1851).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 281).

Derivation (Clifford & Bostock 2007): In honor of Victor Jacquemont (1801–1832) French naturalist and traveller.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect, 30–90 cm long. Ligule an eciliate membrane, 0.2–0.4 mm long. Leaf-blades filiform, involute, 10–20 cm long, 1–2 mm wide, stiff, glaucous. Leaf-blade surface puberulous, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 6–16 cm long, 2 cm wide. Primary panicle branches ascending, 2–3 cm long, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.3–0.4 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate or elliptic, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acute. Upper glume lanceolate or elliptic, 5–7 mm long, membranous, without keels, 3 -veined. Upper glume apex acute.

Florets. Fertile lemma elliptic, subterete, 4.3–5 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn bigenulate, 35 mm long overall, with twisted column. Column of lemma awn 15 mm long, puberulous. Palea 2 -veined, without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. **Western Asia** and **China.** Afghanistan. Tibet. **Indian Subcontinent.** Eastern Himalaya, Pakistan, West Himalaya.

Achnatherum latiglume (Swallen) M.E. Barkworth. *Phytologia*, 74(1): 8 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa latiglumis* Swallen, *Journal of the Washington Academy of Sciences* 23(4): 198, f. 1. 1933. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *L. Abrams* 4469, 22 Jun 1911, USA: California (US-992334).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (126).

Derivation (Clifford & Bostock 2007): *L. latus*, broad; gluma, husk. Glumes broad.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Culms erect, slender, 50–110 cm long. Culm-internodes distally pubescent. Leaf-sheaths pubescent. Ligule an eciliate membrane, 1–4 mm long. Leaf-blades flat or involute, 1–2 mm wide. Leaf-blade surface pilose, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 15–30 cm long. Primary panicle branches distant, 5–10 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets lanceolate, subterete, 13–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, purple, without keels, 3 -veined. Lower glume apex acute or acuminate. Upper glume lanceolate, 25–40 mm long, membranous, purple, without keels, 3 -veined. Upper glume apex acute or acuminate.

Florets. Fertile lemma lanceolate, subterete, 8–9 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 35–45 mm long overall, with twisted column. Column of lemma awn ciliate. Palea 2 -veined, without keels.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

$2n = 70$ (FNA).

Distribution (TDWG). Continent. North America.

Country /Province /State. Southwestern USA. California.

Achnatherum lemmonii (Vasey) M.E. Barkworth. *Phytologia*, 74(1): 8 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa pringlei* var. *lemmonii* Vasey, *Contrib. US Nat. Herb.* 3:55 (1892). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *J.G. Lemmon 5456*, May 1889, USA: California: Plumas Co.: Mohawk Valley (US).

Recent Synonyms: *Stipa lemmonii* (Vasey) Scribn., *U.S. Dept. Agric. Div. Agrost. Circ.*, 30: 3 (1901). *Stipa columbiana* Macoun, *Catal. Canad. Pl.* 4: 191 (1888).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (126 as subsp. *lemmonii* and subsp. *pubescens*).

Derivation (Clifford & Bostock 2007): in honor of John Gill Lemmon (1832–1908) United States forester and botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 10–70 cm long. Culm-internodes scaberulous. Leaf-sheaths glabrous on surface to hirsute. Ligule an eciliate membrane, 1–2.2 mm long, entire or erose, obtuse. Leaf-blades involute, 10–20 cm long, 1.5–2.5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 4–15 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, without keels, 5 -veined. Lower glume apex acuminate. Upper glume lanceolate, 7–12 mm long, hyaline, without keels, 3–5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 5–7.5 mm long, 1.2 mm wide, coriaceous, light brown, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex emarginate, awned, 1 -awned. Principal lemma awn bigeniculate, 18–29 mm long overall, with twisted column, limb limb glabrous or puberulous. Middle segment of lemma awn pubescent. Column of lemma awn pubescent, with 0.5 mm long hairs. Palea 0.66 length of lemma, 2 -veined, without keels.

Flower and Fruit. Lodicules 3, 1.5 mm long. Anthers 3, 3–3.5 mm long, purple. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 24 Poaceae*, part 1 (2007) (130).

Derivation (Clifford & Bostock 2007): *L. lobus*, lobe; -ata, possessing. Lemma lobed.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 40–100 cm long. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 0.2–0.5 mm long. Leaf-blades flat or conduplicate, 25–50 cm long, 1–4 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Peduncle scaberulous above. Panicle contracted, linear, 15–25 cm long, 1–1.5 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–15 mm long, 1.2–1.3 length of upper glume, hyaline, without keels, 3–5 -veined. Lower glume apex acuminate. Upper glume lanceolate, 7–12 mm long, 1–1.5 length of adjacent fertile lemma, hyaline, without keels, 3–5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 7–8 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface pilose, hairy all along. Lemma margins convolute, covering most of palea. Lemma hairs 1.5–2 mm long. Lemma apex dentate, 2 -fid, with lobes 0.7–1.5 mm long, awned, 1 -awned. Principal lemma awn from a sinus, geniculate or bigeniculate, 10–20 mm long overall, with a straight or slightly twisted column. Column of lemma awn hispidulous. Palea without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southwestern USA, South-central USA. Arizona. New Mexico, Texas.

Achnatherum mongholicum (Turcz. ex Trin.) Ohwi. *Journal of Japanese Botany* 17(7): 403 (1941).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*).

TYPE from Mongolia. **Basionym or Replaced Name:** *Stipa mongholica* Turcz. ex Trin., *Bull. Sc. Acad. Petersb.* 1: 67. (1836). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: "Turcz. ined."; "... transbaical.", (US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Mongolia.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 15–60 cm long. Culm-internodes mid-green or purple, distally glabrous. Leaves basal and cauline. Leaf-sheaths mostly shorter than adjacent culm internode, scaberulous, glabrous on surface. Ligule an eciliate membrane, obtuse. Leaf-blades filiform, 1–2 mm wide. Leaf-blade venation with 3–7 secondary veins. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle, comprising 8–20 fertile spikelets. Panicle open, ovate, 5–15 cm long, bearing few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 4.5–6.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, 0.2–0.8 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, subequal in width, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, hyaline, pallid or purple. Lower glume apex acute. Upper glume lanceolate, 4.5–6.5 mm long, hyaline, pallid or purple, without keels. Upper glume apex acute.

Florets. Fertile lemma linear to lanceolate, subterete, 3.3–5.3 mm long, coriaceous, dark brown, without keel, 3 -veined, 0–3 -veined. Lemma surface puberulous, hairy below, hairy on veins. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, bigeniculate, 15–30 mm long overall, with twisted column, limb plumose. Middle segment of lemma awn plumose. Column of lemma awn plumose. Palea 2 -veined, without keels.

Flower and Fruit. Lodicules 3. Anthers 3, anther tip smooth or pubescent. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp.

Achnatherum multinode (Scribn. ex Beal) Valdis-Reyna & Barkworth. *Contributions from the United States National Herbarium* 48: 17 (2003).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. **Basionym or Replaced Name:** *Stipa multinodis* Scribn. ex Beal, *Grasses N. Amer.* 2: 222 (1896). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: C.G. Pringle 385, 14 Aug 1885, Mexico: Chihuahua: Santa Eulalia Mountains (MSC; IT: MO-3055693, MO-5114652, US-825176, US-155154, US-90985).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. multus*, many; *nodus*, knot. Culms many-noded.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Culms erect, 60–100 cm long, wiry, 4–6 -noded. Culm-internodes distally glabrous. Lateral branches sparse, arising from mid culm. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 0.5–1 mm long. Leaf-blades flat or involute, 10–30 cm long, 1–3 mm wide, stiff. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 10–20 cm long. Primary panicle branches appressed or ascending, distant, 2–6 cm long. Panicle branches stiff. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent (tawny), acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, hyaline, pallid, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 25–40 mm long, hyaline, pallid, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 5 mm long, coriaceous, pallid, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma hairs white or tawny. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 25–30 mm long overall, with twisted column. Palea 2 -veined, without keels.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Northeast Mexico. Chihuahua, Zacatecas.

Achnatherum nakaii (Honda) Tateoka. *J. Jap. Bot.* 30:208 (1955).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006) (as *Stipa*).

TYPE from China. **Basionym or Replaced Name:** *Stipa nakaii* Honda, *Rep. First Sc. Exped. Manchoukuo, Sect. IV.* 4 (*Index Fl. Jehol.*) 104 (1936). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Manchuria, Chao-yang: Nakai, Honda & Kitagawa.

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 289).

Derivation (Clifford & Bostock 2007): in honor of Takenoshin Nakai (1822–1952) Japanese botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Butt sheaths pubescent. Culms erect, 60 cm long. Culm-internodes distally glabrous. Culm-nodes glabrous. Leaf-sheaths longer than adjacent culm internode, pubescent (below). Ligule an eciliate membrane. Leaf-blades 25–30 cm long, 2–4 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 20–25 cm long. Primary panicle branches appressed, 2 -nate. Panicle axis scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 5–6.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets. Lower glume lanceolate or oblong, 5.5 mm long, 0.8–0.9 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface puberulous. Lower glume apex acute. Upper glume lanceolate, 6.5 mm long, membranous, 1-keeled, 3 -veined. Upper glume surface puberulous. Upper glume apex acuminate.

Florets. Fertile lemma oblong or ovate, subterete, 5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 12 mm long overall, with twisted column. Palea lanceolate, 4 mm long, 0 -veined, without keels. Palea surface puberulous.

Flower and Fruit. Anthers 3, 4 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China and Mongolia. Inner Mongolia, Manchuria, China North-Central. Mongolia.

Hebei, Shanxi.

Achnatherum nelsonii (Scribn.) M.E. Barkworth. *Phytologia*, 74(1): 9 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa nelsonii* Scribn. ,*U. S. Dept. Agric. Bull. Agrost.* 9: 46. (1898). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: A. *Nelson 3963*, 9 Aug 1898, USA: Wyoming: Albany Co.: Woods Landing, alt. 2600 m (US-556901).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (124).

Derivation (Clifford & Bostock 2007): in honor of Aven Nelson (1859–1952) United States botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 60–100 cm long. Culm-internodes distally pubescent. Leaf-sheaths pubescent. Ligule an eciliate membrane. Leaf-blades flat or involute, 10–20 cm long, 1–5 mm wide. Leaf-blade surface pubescent.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 10–20 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, membranous, without keels. Lower glume apex acuminate. Upper glume lanceolate, hyaline, without keels. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 7 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, with conspicuous apical hairs. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 30–50 mm long overall, with twisted column.

Flower and Fruit. $2n = 36$ (FNA), or 44 (FNA).

Distribution (TDWG). Continent. North America.

Country /Province /State. Subarctic America, Western Canada, Northwest USA, North-central USA, Southwestern USA, South-central USA. Yukon. Alberta, British Columbia, Manitoba, Saskatchewan. Colorado, Idaho, Montana, Oregon, Washington, Wyoming. Kansas, Nebraska. Arizona, California, Nevada, Utah. New Mexico, Texas.

Achnatherum nevadense (B.L. Johnson) M.E. Barkworth. *Phytologia* 74(1): 9 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa nevadensis* B.L.Johnson, *Amer. Journ. Bot.* 49: 257 (1962). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *B.L. Johnson 211*, USA: California: Mono Co.: Upper Twin Lake, near Bridgeport (UC).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (120).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Nevada, USA.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial (tufted), caespitose, clumped densely. Culms 40–90 cm long. Culm-internodes antrorsely scabrous, distally glabrous. Leaf-sheaths smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs lacking. Ligule an eciliate membrane, 0.5 mm long. Leaf-blades filiform, flat or involute, 10–25 cm long, 1–3 mm wide. Leaf-blade surface puberulous (above).

Inflorescence. Inflorescence a panicle. Panicle open, linear, 10–25 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 7–10 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–10 mm long, 1 length of upper glume, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 7–10 mm long, hyaline, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 5–6.5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface villous. Lemma margins convolute, covering most of palea. Lemma hairs 1.5 mm long. Lemma apex acute, awned, 1 -awned. Principal lemma awn bigeniculate, 20–35 mm long overall, with twisted column, limb plumose (first and second segment), with 0.5–1.5 mm long hairs. Column of lemma awn glabrous. Palea 0.5 length of lemma, 2 -veined, without keels. Palea surface pubescent.

Flower and Fruit. Lodicules 2. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

$2n = 68$ (FNA).

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA, Southwestern USA. Oregon, Washington. Arizona, California, Nevada, Utah.

Achnatherum occidentale (Thurb.) M.E. Barkworth. *Phytologia* 74(1): 10 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa occidentalis* Thurb. ex S. Wats., *Bot. King's Exp.* 380. (1871). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *H.N. Bolander 5038*, 1860, USA: California: Yosemite Trail (GH; ILT: US- (fragm. ex GH & photo), US-745821, US-992306, US-344178). LT designated by Hitchcock, *Contr. U.S. Natl. Herb.* 24(7): 242 (1925).

Recent Synonyms: *Stipa elmeri* Piper & Brodie, *U. S. Dept. Agric. Agrost. Bull. No.* 11, 46 (1898).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (122 as subsp. *californicum*, *occidentale* and *pubescens*).

Derivation (Clifford & Bostock 2007): *L. occident*, west; *-ale*, pertaining to. From the western states of the United States.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 80–120 cm long. Culm-internodes distally glabrous or pubescent. Leaf-sheaths glabrous on surface to pubescent. Ligule an

eciliate membrane, 0.5–1 mm long, entire or erose, truncate. Leaf-blades filiform or linear, flat or involute, 10–20 cm long, 1–5 mm wide. Leaf-blade surface glabrous or puberulous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 5–30 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 1–1.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, without keels, 3–5 -veined. Lower glume apex acuminate. Upper glume lanceolate, 7–15 mm long, hyaline, without keels, 3–7 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 5–8 mm long, coriaceous, light brown, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, with conspicuous apical hairs. Lemma margins convolute, covering most of palea. Lemma hairs 0.5–1.5 mm long. Lemma apex acute, awned, 1 -awned. Principal lemma awn bigeniculate, 15–50 mm long overall, with twisted column. Middle segment of lemma awn glabrous or hirtellous. Column of lemma awn glabrous or hirtellous, with 1 mm long hairs. Palea 2–3.5 mm long, 0.33–0.5 length of lemma, 2 -veined, without keels. Palea surface pubescent.

Flower and Fruit. Lodicules 3, 1.5 mm long. Anthers 3, 2.5 mm long. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

$2n = 36$ (FNA).

Distribution (TDWG). Continent. North America.

Country /Province /State. Western Canada, Northwest USA, Southwestern USA. Alberta, British Columbia, Colorado, Idaho, Montana, Oregon, Washington, Wyoming. California, Nevada, Utah.

Achnatherum ordubadense Tzvelev. *Bot. Zhurn.* 78(10): 93 (1993).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*).

TYPE from Russia. **Basionym or Replaced Name:** *Stipa ordubadensis* (Tsvelev) FORSAN (2003). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Azerbaijan, Ordubad: Czerepanov, Egorova & Tsvelev 426 (LE holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. ense*, deniting origin. From Ordubad, Azerbaijan.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 30–60 cm long. Ligule an eciliate membrane. Leaf-blades flat or convolute, 10–20 cm long, 0.5–2 mm wide. Leaf-blade surface ribbed, grooved abaxially, scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 15–25 cm long. Panicle branches capillary, flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 4.2–5.3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, without keels. Lower glume surface smooth, glabrous. Lower glume apex acute or acuminate. Upper glume elliptic, 4.2–6.5 mm long, membranous, without keels. Upper glume surface smooth, glabrous. Upper glume apex acute or acuminate.

Florets. Fertile lemma elliptic, 2.3–3.2 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn curved, 11–15 mm long overall, with a straight or slightly twisted column, deciduous. Column of lemma awn 3–5 mm long. Palea 2 -veined, without keels.

Flower and Fruit. Anthers 3. Stigmas 2.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Caucasus. Transcaucasus.

Achnatherum parishii (Vasey) M.E. Barkworth. *Phytologia* 74(1): 11 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa parishii* Vasey in *Coult. Bot. Gaz.* vii. 33. (1882). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: LT: *S.B. Parish & W.F. Parish 1079*, Aug 1881, USA: California: San Bernardino Co.: San Bernardino Mountains (US-556918; ILT: US-556918). LT designated by Hitchcock, *Contr. U.S. Natl. Herb.* 24(7): 227 (1925); specimen annotated by M.E. Barkworth in 1993 as a lectotype.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (128 as subsp. *parishii* & subsp. *depauperatum*).

Derivation (Clifford & Bostock 2007): in honor of Samuel Bonsall Parish (1838–1928) United States botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–45 cm long. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane. Leaf-blades conduplicate or involute, 7–15 cm long, stiff.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle contracted, linear, 15 cm long. Primary panicle branches 1–3 -nate, 5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 12–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 12–14 mm long, 1.1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 10–12 mm long, hyaline, without keels, 3 -veined. Upper glume apex acute.

Florets. Fertile lemma lanceolate, subterete, 6–8 mm long, coriaceous, light brown, without keel, 5 -veined, more than 3-veined. Lemma surface villous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 1 -awned. Principal lemma awn bigeniculate, 18 mm long overall, with twisted column.

Distribution (TDWG). Continent. North America.

Country /Province /State. **Southwestern USA** and **Mexico.** Arizona, California, Nevada, Utah. Northeast Mexico.

Coahuila, Neuvo Leon.

Achnatherum pekinense (Hance) Ohwi. *Bull. Nat. Sci. Mus., Tokyo*, No. 33, 66 (1953).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

TYPE from China. **Basionym or Replaced Name:** *Stipa pekinensis* Hance, *Journ. Bot.* 15: 268 (1877). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: China, Peking: *Williams 13831*.

Recent Synonyms: *Achnatherum extremiorientale* (H. Hara) Keng, *Fl. Ill. Pl. Prim. Sin., Gram.* 590, f. 524 (1959).

Illustrations (Books): T.Koyama, *Grasses of Japan and its neighbouring regions* (1987) (208, Fig 74), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 291).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Peking, now Beijing, China.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Cataphylls evident. Butt sheaths persistent and investing base of culm. Culms erect, 70–150 cm long, 2.5–4 mm diam., 3–4 -noded. Leaf-sheaths loose. Ligule an eciliate membrane, 0.5–1 mm long, erose, truncate. Leaf-blades involute, 30–60 cm long, 7–15 mm wide, stiff. Leaf-blade surface scabrous, rough adaxially, glabrous or pubescent, hairy adaxially. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic or ovate, loose or effuse, 15–40 cm long, 2–4 cm wide. Primary panicle branches 2–6 -nate, 4–12 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume lanceolate, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface glabrous to pubescent. Lower glume apex acute. Upper glume lanceolate, 8–11 mm long, membranous, without keels, 3 -veined. Upper glume surface glabrous to pubescent. Upper glume apex obtuse or acute.

Florets. Fertile lemma lanceolate, subterete, 6–8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins convergent above. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 20–25 mm long overall, with twisted column. Palea 5 mm long, 2 -veined, without keels. Palea surface pubescent, hairy on back.

Flower and Fruit. Anthers 3, 4–6 mm long, anther tip penicillate. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, 4–5 mm long. Hilum linear.

$2n = 24$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Siberia, Russian Far East, **China, Eastern Asia.** Buryatiya, Chita, Irkutsk. Kuril Is. China South Central, Inner Mongolia, Manchuria, China North-Central, China Southeast. Japan Hokkaido, or Honshu. Japan, Korea.

Achnatherum pelliotii (Danguy) M. Roser & H.R. Hamasha. *Syst. Bot. Evol.* 298: 365 (2012).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Russia. **Basionym or Replaced Name:** *Stipa pelliotii* Danguy, *Lecomte, Not.Syst.* 2: 167 (1912). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Turkestan: Zamutch-tagh, montagnes dénudées, 1700 m, 28 July 1907, *Pelliot & Vaillant* 375 (HT: ?).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 279 as *Ptilagrostis*).

Derivation (Clifford & Bostock 2007): in honor of Paul Pelliot (1878–1945) French sinologist and explorer who, in company with Louis Vaillant, a medical doctor, collected c. 800 plant specimens from central Asia and China.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated, scaly. Culms erect, 25–30 cm long. Culm-internodes channelled, distally glabrous. Leaf-sheaths 1–6 cm long. Ligule a fringe of hairs or absent. Leaf-blades filiform, involute, 3–10 cm long, 1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse. Primary panicle branches 2 -nate. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 5–6 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets. Lower glume lanceolate, 5–6 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 5 mm long, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma lanceolate, subterete, 3.5 mm long, membranous, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma surface villous. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, curved, 25–30 mm long overall, deciduous, limb plumose. Palea 3.25 mm long, 2 -veined, without keels. Palea surface hirsute.

Flower and Fruit. Anthers 3, anther tip smooth. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China, Mongolia. Inner Mongolia, China North-Central, Qinghai, Xinjiang, Mongolia.
Gansu.

Achnatherum perplexum P.S. Hoge & M.E. Barkworth. *Phytologia* 74(1): 11 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa perplexa* (Hoge & Barkworth) J.K. Wipff & S.D. Jones. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *M.E. Barkworth 4764*, 8 Sep 1985, USA: New Mexico: Bernalillo Co. (US-3239133).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (134).

Derivation (Clifford & Bostock 2007): L. possessing the characters of two related species.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations intravaginal. Culms erect, 30–70 cm long. Culm-internodes smooth or scaberulous, distally glabrous. Leaf-sheaths longer than adjacent culm internode, smooth or scaberulous, glabrous on surface, outer margin glabrous or hairy. Ligule a ciliolate membrane, 0.3–0.8 mm long. Leaf-blades 1–3 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 6–20 cm long, 1–2 cm wide. Primary panicle branches ascending. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5–0.85 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–14 mm long, 1.2–1.4 length of upper glume, hyaline, without keels, 3–5 -veined. Lower glume surface scabrous. Lower glume apex acuminate. Upper glume lanceolate, 7.5–10 mm long, 1.5–1.7 length of adjacent fertile lemma, hyaline, without keels, 3–5 -veined. Upper glume surface scabrous. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 4.5–6.5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pilose, hairy all along. Lemma margins convolute, covering most of palea. Lemma hairs 0.5–1.8 mm long. Lemma apex dentate, 2 -fid, with lobes 0.15–0.45 mm long, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–20 mm long overall, with a straight or slightly twisted column. Palea 2.5–3.75 mm long, without keels.

Flower and Fruit. Anthers 3, 2.25–4.2 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA, Southwestern USA, South-central USA. Colorado, Arizona, Utah, New Mexico.

Achnatherum petriei (Buchanan) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 582 (1996).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from New Zealand. **Basionym or Replaced Name:** *Stipa petriei* Buchanan, *Man. Indig. Grasses, N. Zeal.* t. 172. f. 2 (1880). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Buchanan folio*, New Zealand (WELT-59622).

Stipa setacea.

Illustrations (Books): T.D.Stanley & E.Ross, *Flora of South East Queensland, Gramineae* (1989) (105, Fig. 17 as *Stipa setacea*).

Derivation (Clifford & Bostock 2007): in honor of Donald Petrie (1846–1925) Scots-born New Zealand educationist and amateur botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Basal innovations extravaginal. Culms erect, 30–60 cm long, wiry. Culm-internodes smooth. Culm-nodes purple, glabrous. Lateral branches lacking or sparse. Leaf-sheaths 1–3 cm long, glabrous on surface or pubescent, with reflexed hairs. Leaf-sheath oral hairs lacking or pubescent. Leaf-sheath auricles erect, 0.5–1 mm long. Ligule an eciliate membrane, 0.3–0.5 mm long. Leaf-blades aciculate, involute, 15–30 cm long, 0.8 mm wide, stiff. Leaf-blade surface pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 15–25 cm long. Panicle axis scabrous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.1–0.3 mm long, pilose, disarticulating obliquely. Floret callus hairs 1 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume lanceolate, 5–7 mm long, hyaline, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex setaceously acuminate. Upper glume lanceolate, 5–7 mm long, hyaline, without keels, 3 -veined. Upper glume lateral veins obscure. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 3–5 mm long, coriaceous, without keel, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma surface pubescent. Lemma margins involute, interlocking with palea keels. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 30–40 mm long overall, with a straight or slightly twisted column. Column of lemma awn 5–10 mm long, puberulous. Palea 1 length of lemma, 2 -veined. Palea keels contiguous above a sulcus. Palea surface pilose, hairy on back, hairy above.

Flower and Fruit. Lodicules 3, 0.5–1 mm long. Anthers 3, 1.7 mm long, eventually exerted, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp, 2.5–3.5 mm long. Hilum linear.

Cleistogenes absent.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand South I.

Achnatherum pinetorum (M.E. Jones) M.E. Barkworth. *Phytologia* 74(1): 12 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa pinetorum* M. E. Jones, *Proc. Calif. Acad. Ser.* 2:5 : 724. (1895). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: LT: *M.E. Jones 6023*, USA: Utah: Panguitch Lake (US-236788). LT designated (as NT) by Barkworth, *Phytologia* 74: 12 (1993).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (136).

Derivation (Clifford & Bostock 2007): L. of the pines. Growing in pine woods.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 10–30 cm long. Leaves mostly basal. Leaf-sheaths glabrous on surface or puberulous, with reflexed hairs. Ligule an eciliate membrane, 0.5 mm long. Leaf-blades erect, flexuous, filiform, involute, 3–12 cm long, 2.5 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 5–12 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 1 length of upper glume, membranous, without keels, 3–5 -veined. Lower glume apex

acuminate. Upper glume linear, 10 mm long, hyaline, without keels, 3–5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 6–7 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface villous. Lemma margins convolute, covering most of palea. Lemma hairs 1.5–2 mm long. Lemma apex dentate, 2 -fid, with lobes 1–1.5 mm long, acute, awned, 1 -awned. Principal lemma awn from a sinus, bigeniculate, 20 mm long overall, with twisted column. Column of lemma awn glabrous. Palea 0.8 length of lemma, 2 -veined, without keels. Palea surface villous.

Flower and Fruit. Lodicules 3, 1.5 mm long. Anthers 3, 2 mm long, purple. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

$2n = 32$ (FNA).

Distribution (TDWG). **Continent.** North America.

Country /Province /State. **Northwest USA, Southwestern USA.** Idaho, Wyoming, Arizona, California, Nevada, Utah.

Achnatherum psilanthrum Keng ex Tzvelev. *Akad. Nauk SSSR Bot. Inst. Komarova. Rast. Tsentral. Azii, Fasc. 4, 4* (1968).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Labrang: Anon 5892.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk *psilos*, bare; *antheros*, blooming. Lemma awns smooth.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Culms erect, 40–60 cm long, 1–1.5 mm diam., 2–3 -noded. Leaf-sheaths mostly shorter than adjacent culm internode, smooth. Ligule an eciliate membrane, 0.5 mm long, scarious, entire or erose, truncate. Leaf-blades filiform, involute, 8–12 cm long, 1–1.5 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 5–12 cm long, 1 cm wide. Primary panicle branches ascending, 1–2.5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus 0.3 mm long, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets. Lower glume lanceolate, 6 mm long, 0.9 length of upper glume, membranous, purple, 1-keeled, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 6 mm long, membranous, purple, 1-keeled, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 4 mm long, membranous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins meeting above. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15 mm long overall, with twisted column. Column of lemma awn glabrous. Palea 2 -veined, without keels. Palea surface pubescent, hairy on back.

Flower and Fruit. Anthers 3, 2 mm long, anther tip smooth. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). **Continent.** Temperate Asia.

Country /Province /State. **China.** China South Central, China North-Central, Qinghai, Gansu, Sichuan.

Achnatherum pubicalyx Ohwi. *Fl. Tsinling*. 1(1): 153 (1976).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006) (as *Stipa*).

TYPE from Korea. **Basionym or Replaced Name:** *Stipa pubicalyx* Ohwi, *Journ. Jap. Bot.* 17: 401 (1941). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Korea, Mutoho: Cho 58.

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 288).

Derivation (Clifford & Bostock 2007): *L. pubes*, hair of adulthood; *Gk kalyx*, cup. Glumes hairy.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Cataphylls evident. Culms erect, 60–100 cm long, 3–4 -noded. Leaf-sheaths longer than adjacent culm internode, antrorsely scabrous. Ligule an eciliate membrane, 1 mm long, truncate. Leaf-blades 20–40 cm long, 3–5 mm wide. Leaf-blade surface scabrous, rough abaxially, pubescent, densely hairy, hairy adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Peduncle antrorsely scabrous above. Panicle open, elliptic or ovate, 15–25 cm long. Primary panicle branches ascending, 2–4 -nate, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.8 mm long, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface puberulous. Lower glume apex obtuse or acute. Upper glume lanceolate, 8–9 mm long, membranous, without keels, 3 -veined. Upper glume surface puberulous. Upper glume apex obtuse or acute.

Florets. Fertile lemma lanceolate, subterete, 6–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma apex emarginate, awned, 1 -awned. Principal lemma awn geniculate, 10–25 mm long overall, with twisted column, persistent. Column of lemma awn hispidulous. Palea without keels.

Flower and Fruit. Anthers 3, 4–5 mm long, anther tip penicillate. Stigmas 2.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China, Mongolia. Inner Mongolia, Manchuria, China North-Central, Qinghai, Xinjiang. Mongolia. Henan. Sichuan, Yunnan.

Achnatherum richardsonii (Link) M.E. Barkworth. *Phytologia* 74(1): 12 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Canada. **Basionym or Replaced Name:** *Stipa richardsonii* Link, *Hort. Berol.* 2 : 245. (1833). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: Cultivated in Hortus Berolensis from seed sent by Richardson (B (destroyed); IT: LE-TRIN-1436.01 (fragm. ex B)).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa robusta* (Vasey) Scribn., *US Dept. Agric., Div. Agrost. Bull.* 5:23 (1897). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: CT: G.R. Vasey s.n., 1881, USA: New Mexico (US-993051). see also Barkworth, *Phytologia* 74: 12 (1993); *Taxon* 42: 711 (1993).

Recent Synonyms: *Achnatherum lobatum* (Swallen) M.E. Barkworth, *Phytologia*, 74(1): 9 (1993).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (130).

Derivation (Clifford & Bostock 2007): *L. robust.* Culms tall, or leaf-blades or spikelets large.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, robust, 100–150 cm long, 3–6 mm diam. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 0.5–4 mm long. Collar pubescent. Leaf-blades flat or involute, 30–50 cm long, 5–8 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 25–50 cm long, 1–2 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–13 mm long, 1 length of upper glume, hyaline, without keels, 3–5 -veined. Lower glume apex attenuate. Upper glume lanceolate, 8–13 mm long, 1.3–1.6 length of adjacent fertile lemma, hyaline, without keels, 3–5 -veined. Upper glume apex attenuate.

Florets. Fertile lemma linear, subterete, 6–8 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma hairs 1–2 mm long. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 20–38 mm long overall, with 12–18 mm long limb, with twisted column. Column of lemma awn glabrous or puberulous. Palea without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Vasey s.n.*, Aug 1884, USA: New Mexico: Santa Fe Co.: Santa Fe (US-556905; ILT: US-84603). Specimen annotated by M.E. Barkworth in 1993 as a lectotype..

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (134).

Derivation (Clifford & Bostock 2007): in honor of Frank Lamson Scribner (1851–1938) United States agrostologist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Culms erect, 30–70 cm long. Culm-internodes distally glabrous or pubescent. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule an eciliate

membrane, 0.5–1 mm long. Leaf-blades flat, 15–25 cm long, 2–4 mm wide. Leaf-blade surface scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear, dense, 10–25 cm long. Primary panicle branches appressed, 1–5 cm long. Panicle branches pubescent in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent (tawny), acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, pallid, without keels, 3 -veined. Lower glume surface asperulous. Lower glume apex attenuate. Upper glume lanceolate, 10–15 mm long, membranous, pallid, without keels, 3 -veined. Upper glume surface asperulous. Upper glume apex attenuate.

Florets. Fertile lemma lanceolate, subterete, 8 mm long, coriaceous, pallid, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent or pilose (longer above). Lemma margins convolute, covering most of palea. Lemma hairs white, 1–2 mm long. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 14–20 mm long overall, with twisted column. Middle segment of lemma awn 3–5 mm long. Column of lemma awn 3–5 mm long, glabrous. Palea 2 -veined, without keels.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

$2n = 40$ (FNA).

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA, North-central USA, South-central USA. Colorado. Oklahoma. New Mexico.

Achnatherum sibiricum (L.) Keng. *Claves Gen. & Spec. Gramin. Sinic.* 212 (1957).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006) (as *Stipa sibirica*).

TYPE from Russia. **Basionym or Replaced Name:** *Stipa sibirica* (L.) Lam., *Illustr.* i. 158. (1791). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: LT: (LINN-95.11). LT designated by Scholz in Cafferty et al., *Taxon* 49(2): 248 (2000).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 287).

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Siberia.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Rhizomes short. Culms 60–150 cm long. Ligule an eciliate membrane, 0.4–0.9 mm long. Leaf-blades flat, 20–40 cm long, 3.5–8(–12) mm wide. Leaf-blade surface scaberulous or scabrous, rough on both sides, puberulous, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, nodding, 10–40 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7.5–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident or elongated, 0.5–1 mm long, pubescent, obtuse or acute or pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate or elliptic, 1 length of upper glume, membranous, pallid or mid-green, without keels, 3 -veined. Lower glume apex acute. Upper glume lanceolate or elliptic, 7.5–10 mm long, 1.2 length of adjacent fertile lemma, membranous, pallid or mid-green, without keels, 3 -veined. Upper glume apex acute.

Florets. Fertile lemma elliptic, subterete, 6–8 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent, hairy all along. Lemma margins convolute, covering most of palea. Lemma apex surmounted by a ring of hairs, awned, 1 -awned. Principal lemma awn bigeniculate, 13–20 mm long overall, with twisted column. Column of lemma awn puberulous, with 0.2 mm long hairs. Palea 2 -veined, without keels.

Flower and Fruit. Anthers 3, anther tip penicillate. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

$2n = 24$ (2 refs TROPICOS).

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. Siberia, Russian Far East, **Middle Asia, Caucasus, Western Asia, China, Mongolia, Eastern Asia, Russia.** Kazakhstan, Kirgizistan, Uzbekistan. Iran. China South Central, Inner Mongolia, Manchuria, Qinghai, China Southeast, Tibet, Xinjiang. Mongolia. **Indian Subcontinent.** Pakistan.

Henan. Sichuan, Yunnan.

Achnatherum splendens (Trin.) Nevski. *Acta Inst. Bot. Acad. Sci. URSS*, Ser. 1, Fasc. 4, 224 (1937), in obs. ; Ohwi in *Journ. Jap. Bot.* xvii. 404 (1941).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960) (as *Stipa*), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. **Basionym or Replaced Name:** *Stipa splendens* Trin., *Spreng. Neue Entdeck.* 2 : 54. (1821). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: "Hab. in transbaicalensibus Sibiriae.".

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (119), S-L Chen et al, *Flora of China*, Illustrations, *Poaceae* (2007) (Fig. 282).

Images: R.Darke, *Ornamental Grasses* (2004);, R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);.

Derivation (Clifford & Bostock 2007): L. shining. Lemmas glossy.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Culms robust, 50–250 cm long. Ligule an eciliate membrane, 2.5–10 mm long. Leaf-blades flat or involute, 20–45 cm long, 4–10 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, dense or loose, 15–50 cm long, 10–35 cm wide. Primary panicle branches whorled at most nodes. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5–6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.3 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume elliptic, 4–4.5 mm long, 0.7–0.8 length of upper glume, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume elliptic, 5–6 mm long, membranous, without keels, 3 -veined. Upper glume apex acute.

Florets. Fertile lemma elliptic, subterete, 4.8–5.7 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2-fid, with lobes 0.5–1.3 mm long, awned, 1 -awned. Principal lemma awn straight or geniculate, 6–12 mm long overall, with a straight or slightly twisted column. Palea 2 -veined, without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

$2n = 42$ (FNA), or 48 (FNA).

Distribution (TDWG). Continent. Europe, Temperate Asia, Tropical Asia.

Region. Eastern Europe.

Country /Province /State. Central European Russia, East European Russia, North European Russia, South European Russia. Siberia, **Middle Asia, Western Asia, China, Mongolia, Russia.** Buryatiya, Chita, Irkutsk, Tuva. Kazakhstan, Kirgizistan, Turkmenistan, Tadjikistan, Uzbekistan. Afghanistan, Iran. Inner Mongolia, Manchuria, China North-Central, Qinghai, China Southeast, Tibet, Xinjiang. Mongolia. **Indian Subcontinent.** India, Pakistan.

Gansu, Shanxi. Henan. Sichuan, Yunnan. Himachal Pradesh, Jammu Kashmir, Uttaranchal.

Achnatherum stillmanii (Bol.) M.E. Barkworth. *Phytologia* 74(1): 14 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa stillmanii* Boland., *Proc. Calif Acad.* 4 :169. (1870). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *H.N. Bolander s.n.*, Jul 1870, USA: California: Sierra Nevada, Blue Canyon (NY; IT: US-556922).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (119).

Derivation (Clifford & Bostock 2007): in honor of Jacob Davis Babcock Stillman (1819–1888), American physician and amateur botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 70–100 cm long, 4–5 -noded. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs. Leaf-blades 15–30 cm long, 3–6 mm wide. Leaf-blade surface ribbed, scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, interrupted, 10–20 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 15–18 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acuminate, awned, 1 -awned, awn 2–3 mm long. Upper glume lanceolate, 15–28 mm long, membranous, without keels, 3–5 -veined. Upper glume surface asperulous. Upper glume apex acuminate, awned, 1 -awned, awn 2–3 mm long.

Florets. Fertile lemma lanceolate, subterete, 8 mm long, coriaceous, pallid, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex lobed, 2 -fid, with lobes 2–3 mm long, awned, 1 -awned. Principal lemma awn from a sinus, bigeniculate, 25–30 mm long overall, with twisted column. Palea without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southwestern USA. California.

Achnatherum swallenii (C.L. Hitchc. & Spellenb.) M.E. Barkworth. *Phytologia* 74(1): 14 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Oryzopsis*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Oryzopsis swallenii* C.L.Hitchcock & Spellenberg, *Brittonia*, 20: 164 (1968). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *C.L. Hitchcock 23868*, 7 Jul 1965, USA: Idaho: Clark Co.: just N of Birch Creek, along Hwy. 28, near the Lemhi Co. line (WTU-227273; IT: TEX, US-3465271).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (136).

Derivation (Clifford & Bostock 2007): in honor of Jason Richard Swallen (1903–1991) United States botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Flower and Fruit. $2n = 34$ (FNA).

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA. Idaho, Wyoming.

Achnatherum thurberianum (Piper) M.E. Barkworth. *Phytologia* 74(1): 14 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa thurberianum* Piper, *U. S. Dept. Agric. Circ. Agrost.* 27 : 10 (1900). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Pickering & Brackenridge s.n.*, USA: Washington: N branch of the Columbia and Okanogan (?; IT: US-556917).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (126).

Derivation (Clifford & Bostock 2007): in honor of George Thurber (1821–90) United States botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 30–70 cm long. Culm-nodes pubescent. Leaf-sheaths glabrous on surface to hirsute. Ligule an eciliate membrane, 2–5 mm long, scaberulous on abaxial surface, lacerate, truncate or acute. Leaf-blades filiform, involute, 10–15 cm long, 1–2.2 mm wide. Leaf-blade surface scabrous, rough abaxially, pilose, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 7–13 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1–1.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, much thinner above, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 9–14 mm long, hyaline, much thinner above, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 7–9 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy all along. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 1 -awned. Principal lemma awn bigeniculate, 40–50 mm long overall, with twisted column. Middle segment of lemma awn 10 mm long, hirsute. Column of lemma awn 10 mm long, hirsute, with 1–2 mm long hairs. Palea 2 -veined, without keels.

Flower and Fruit. Lodicules 3, 2 mm long. Anthers 3, 3–4 mm long. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

$2n = 34$ (FNA).

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA, Southwestern USA. Idaho, Oregon, Washington. Arizona, California, Nevada, Utah.

Achnatherum wallowaensis J. Maze & K. Robson. *Madroqo* 43(3): 401, f. 1–2. 1996.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Oryzopsis*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Stipa wallowaensis*. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Oregon: Wallowa Co.: Wallowa-Whitman National Forest, Ca. 34 km N of Enterprise, near Boner Gulch along FS road 46, 45: 43° 41.16' N, 117° 08' 10.32" W (SW 1/4 of SE 1/4, sect 24 T3N, R45E), 1481 m, 26 Jun 1993, *J. Maze, E. Maze, K.A. Robson & T. Henn 1007* (HT: US; IT: COLO, DAV, ID, NMC, OCS, UBC, UC, UTC, WTU).

Recent Synonyms: *Oryzopsis wallowensis* (Maze & Robson) FORSAN.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (138 as *A. wallowaense*).

Derivation (Clifford & Bostock 2007): *L. ense*, denoting origin. From Wallawa Mountains, Oregon, USA.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 10–45 cm long. Leaf-sheaths glabrous on surface or puberulous. Ligule an eciliate membrane. Leaf-blades erect, involute, 5–10 cm long, 0.5–1 mm wide. Leaf-blade surface pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 6.3–14.8 cm long. Primary panicle branches drooping. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, curved.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, dorsally compressed, 3.5–7 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume oblong, 3.5–7 mm long, 1.1 length of upper glume, membranous, without keels. Lower glume apex obtuse or acute. Upper glume oblong, 3–6.5 mm long, 1 length of adjacent fertile lemma, membranous, without keels. Upper glume apex obtuse or acute.

Florets. Fertile lemma oblong, dorsally compressed, 3–3.5 mm long, 1–1.5 mm wide, coriaceous, dark brown or black, without keel. Lemma surface glabrous. Lemma margins convolute, covering most of palea. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn 8–11 mm long overall, deciduous. Palea 1 length of lemma.

Flower and Fruit. Lodicules 3. Anthers 2 mm long, pallid.

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA. Idaho, Oregon.

Achnatherum webberi (Thurb.) M.E. Barkworth. *Phytologia* 74(1) 14 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Oryzopsis*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Eriocoma webberi* Thurb., *S. Wats. Bot. Calif.* 2: 283 (1880). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: T: *Bolander s.n.*, USA: California: Sierra Valley.

Recent Synonyms: *Oryzopsis webberi* (Thurb.) Benth. ex Vasey, *Gram. U. St.* 23. (1883).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (136).

Derivation (Clifford & Bostock 2007): in honor of David Gould Webber (1809-) United States physician, miner and miller.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 10–30 cm long. Culm-internodes solid. Leaves mostly basal. Ligule an eciliate membrane, 0.3–0.5 mm long, glabrous on abaxial surface. Leaf-blades elliptic, involute, 5–10 cm long, 0.5 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 4–7 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, subterete, 7–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus 0.3 mm long, bearded, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–9 mm long, 1 length of upper glume, membranous, without keels, 5 -veined. Lower glume lateral veins obscure. Lower glume surface asperulous. Lower glume apex acuminate. Upper glume lanceolate, 7–9 mm long, 1.2 length of adjacent fertile lemma, membranous, without keels, 5 -veined. Upper glume lateral veins obscure. Upper glume surface asperulous. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 6–7 mm long, coriaceous, without keel. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, with lobes 0.5–1 mm long, awned, 1 -awned. Principal lemma awn from a sinus, straight or curved, 5–8 mm long overall, deciduous. Palea coriaceous, 2 -veined, without keels.

Flower and Fruit. Lodicules 3, 1.5 mm long. Anthers 1.5 mm long.

$2n = 32$ (FNA).

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA, Southwestern USA. Oregon. California, Nevada, Utah.

Achnatherum x bloomeri (Bol.) Barkworth. *Phytologia* 74(1): 14 (1993).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (170).

Derivation (Clifford & Bostock 2007): L,dropping off early. Florets or spikelets shed shortly after anthesis.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA. Montana, Wyoming.

Aciachne acicularis S. Laegaard. *Nordic J. Bot.*, 7(6): 669 (1987).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Bolivia. **Basionym or Replaced Name:** *Acamptocladus sessilispicus* (Buckley) Nash. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Renvoize & Cope 4164*, 08 Apr 1981, Bolivia; LaPaz, Murillo: 3800 m (K; IT: MO, U). det. Laegaard, S. 5/1990.

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (373), S.A.Renvoize, *Gramineas de Bolivia* (1998) (95, Fig. 19).

Derivation (Clifford & Bostock 2007): *L. acus*, needle; *-ulus*, diminutive; *-are*, pertaining to. Leaf-blades sharp-pointed.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, cushion forming. Culms 1–3 cm long. Lateral branches ample. Ligule an eciliate membrane, 0.7 mm long. Leaf-blades aciculate, conduplicate, 0.4–1 cm long, 0.3–0.4 mm wide, stiff. Leaf-blade venation comprising 3 vascular bundles, with 3 secondary veins. Leaf-blade surface pubescent, hairy adaxially. Leaf-blade apex acute, pungent.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1–3 fertile spikelets, shorter than basal leaves. Spikelets solitary.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 4–4.6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous, truncate.

Glumes. Glumes persistent, similar, shorter than spikelet, similar to fertile lemma in texture. Lower glume ovate, 1.8–2.2 mm long, 1 length of upper glume, coriaceous, without keels, 3–5 -veined. Lower

glume apex obtuse. Upper glume ovate, 1.8–2.2 mm long, 0.5 length of adjacent fertile lemma, coriaceous, without keels, 3–5 -veined. Upper glume apex obtuse.

Florets. Fertile lemma oblong, subterete, 4–4.6 mm long, coriaceous, shiny, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex rostrate. Palea coriaceous, 2 -veined, without keels.

Flower and Fruit. Lodicules 3, membranous, veinless. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica, Northern South America, Western South America. Costa Rica. Venezuela. Bolivia, Colombia, Ecuador, Peru. Catamarca.

Aciachne flagellifera S. Laegaard. *Nordic J. Bot.* 7(6): 669 (1987).

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ecuador, Paso de la Virgen: Laegaard 53862 (AAU holo, BM, F, G, GH, K, MO, NY, P, S, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. flagellum*, whip; fero, bear. Tip of leaf-blade thread-like.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, cushion forming. Culms 1–3 cm long. Lateral branches ample. Ligule an eciliate membrane, 0.7 mm long. Leaf-blades erect or ascending, aciculate, conduplicate, 0.4–1 cm long, 0.3–0.4 mm wide, stiff. Leaf-blade surface pubescent, hairy adaxially. Leaf-blade apex acute, pungent, filiform (1–1.5mm,flexuous), hairy.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1–3 fertile spikelets, shorter than basal leaves. Spikelets solitary.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 4–4.6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous, truncate.

Glumes. Glumes persistent, similar, shorter than spikelet, similar to fertile lemma in texture. Lower glume ovate, 1.8–2.2 mm long, 1 length of upper glume, coriaceous, without keels, 3–5 -veined. Lower glume apex obtuse. Upper glume ovate, 1.8–2.2 mm long, 0.5 length of adjacent fertile lemma, coriaceous, without keels, 3–5 -veined. Upper glume apex obtuse.

Florets. Fertile lemma oblong, subterete, 4–4.6 mm long, coriaceous, shiny, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex rostrate. Palea coriaceous, 2 -veined, without keels.

Flower and Fruit. Lodicules 3, membranous, veinless. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia, Ecuador.

Aciachne pulvinata Benth. *Hook. Ic. Pl.* t. 1362 (1881).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: Jameson 157, May 1844, Ecuador: abundant near Salinas on marshy ground forming a dense mass (K!; ILT: GH, US). LT designated by Laegaard, *Nord. J. Bot.* 7: 667 (1987).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (95, Fig. 19), E.G.Nicora, *Los Generos de Gramineas de America Austral* (1987) (199, Fig. 57), W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (23, Fig. 1).

Illustrations (Journals): *Hooker's Icones Plantarum* (t.1362 (1881)), *Ruizia* (13:85, Fig.9e-f (1993)).

Derivation (Clifford & Bostock 2007): *L. pulvinus*, cushion; -ata, possessing. Habit cushion-like.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, cushion forming. Culms 1–3 cm long. Leaf-sheaths longer than adjacent culm internode. Ligule an eciliate membrane, 0.7 mm long. Leaf-blades aciculate, conduplicate, 0.4–1 cm long, stiff. Leaf-blade venation comprising 3 vascular bundles, with continuous uniform subepidermal sclerenchyma layer on the underside. Leaf-blade surface pubescent, hairy adaxially. Leaf-blade apex acute, pungent.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1(–3) fertile spikelets, shorter than basal leaves. Spikelets solitary.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus truncate.

Glumes. Glumes persistent, similar, shorter than spikelet, similar to fertile lemma in texture. Lower glume oblong, 1.5 mm long, 1 length of upper glume, coriaceous, without keels, 3–5 -veined. Lower glume apex obtuse. Upper glume oblong, 1.5 mm long, 0.5 length of adjacent fertile lemma, coriaceous, without keels, 3–5 -veined. Upper glume apex obtuse.

Florets. Fertile lemma oblong, lanceolate in profile, 3 mm long, coriaceous, shiny, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex rostrate. Palea coriaceous, 2 -veined, without keels. Palea apex emarginate.

Flower and Fruit. Lodicules 3, membranous, veinless. Anthers 3.

$2n = 22$ (1 ref TROPICOS).

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica, Northern South America, Western South America, Southern South America. Costa Rica. Venezuela. Bolivia, Colombia, Ecuador, Peru. Argentina Northwest.

Acidosasa breviclavata W.T. Lin. *Bamboo Res.* 1986(2): 27 (1986).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Feng-Kai: Xiao 1905 (SCAC holo).

Recent Synonyms: *Acidosasa gracilis* W.T. Lin & X.B. Ye, *Acta Phytotax. Sin.* 26(2): 149, f. 4 (1988).

Illustrations: None found.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 200–300 cm long, 10–15 mm diam., woody. Culm-internodes terete, thin-walled, distally glabrous. Lateral branches dendroid. Branch complement three. Culm-sheaths present, deciduous, brown and purple, obscurely mottled with last colour, hispid, with appressed hairs, hairy on margins, without auricles, glabrous on shoulders. Culm-sheath ligule ciliolate. Culm-sheath blade lanceolate, 0.5–1 cm long. Leaves 5–6 per branch. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 7–14 cm long, 8–12 mm wide. Leaf-blade venation with 8 secondary veins, with distinct cross veins. Leaf-blade surface glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes or comprising only a few spikelets. Racemes 1, single, bearing few fertile spikelets, bearing 2–3 fertile spikelets on each. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 20–40 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 5–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear or oblong, laterally compressed, 25–35 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 3–4 mm long.

Glumes. Glumes several, 4 empty glumes, persistent, similar, shorter than spikelet. Lower glume ovate, 5 mm long, chartaceous, without keels. Lower glume apex acute. Upper glume ovate, 11 mm long, chartaceous, without keels. Upper glume apex acute, mucronate.

Florets. Fertile lemma ovate, 12 mm long, chartaceous, without keel, more than 3-veined. Lemma surface glabrous. Lemma apex acuminate. Palea 10 mm long. Palea keels ciliate. Palea apex pubescent. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, ciliate. Anthers 6, 3 mm long. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China Southeast.
Guangdong.

Acidosasa brilletii (A. Camus) C.S. Chao & Renvoize. *Kew Bulletin* 44(2): 351 (1989).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Vietnam. **Basionym or Replaced Name:** *Arundinaria brilletii*. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Indochina, Tonkin, Yen-lap: Brillet 90.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of F. Brillet, French botanist who collected in Tonkin.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Butt sheaths absent. Culms woody. Culm-internodes terete, thin-walled. Lateral branches dendroid. Culm-sheaths present. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 12–19 cm long, 12–18 mm wide. Leaf-blade venation with 8–10 secondary veins, with distinct cross veins. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 5–40 mm long.

Fertile Spikelets. Spikelets comprising 10–17 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 40–100 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 5–6 mm long, pubescent, hairy at tip.

Glumes. Glumes several, 3 empty glumes, persistent, similar, shorter than spikelet. Lower glume ovate, 5 mm long, chartaceous, without keels, 7–9 -veined. Lower glume margins ciliate. Lower glume apex acute, mucronate. Upper glume lanceolate or ovate, 12 mm long, chartaceous, without keels, 11–13 -veined. Upper glume margins ciliate. Upper glume apex acute, mucronate.

Florets. Fertile lemma oblong or ovate, 15–18 mm long, chartaceous, without keel, 15–19 -veined, more than 3-veined. Lemma lateral veins with cross-veins. Lemma apex obtuse, mucronate. Palea 11–14 mm long, 2 -veined. Palea keels scaberulous. Palea apex obtuse. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, ciliate. Anthers 6, anther tip smooth. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Vietnam.

Acidosasa chienouensis (T.H. Wen) C.S. Chao & T.H. Wen. *J. Bamboo Res.* 7(1): 31 (1988).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: China, Jianou: Chang & Hua 81607 (ZJFI holo).

Recent Synonyms: *Acidosasa glauca* B.M. Yang, *Acta Phytotax. Sin.* 22 (1): 85–86, f. 1 (1984).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 141).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Jianou, Fujian Province, China.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes short, pachymorph. Culms erect, 700–1300 cm long, 40–100 mm diam., woody. Culm-internodes terete, thin-walled, 30–48 cm long. Lateral branches dendroid. Branch complement three. Culm-sheaths present, deciduous, 25–30 cm long, with basal lobes, hispid, hairy on margins, auriculate, ciliate on shoulders. Culm-sheath ligule 3.32–4.8 mm high,

ciliate. Culm-sheath blade lanceolate, deciduous, spreading, 10–20 cm long, 10–12 mm wide, pubescent. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs ciliate, deciduous. Ligule a ciliolate membrane, 1.66–2.4 mm long, pubescent on abaxial surface, truncate. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 10–15 cm long, 8–18 mm wide. Leaf-blade venation with 10–12 secondary veins, with distinct cross veins. Leaf-blade margins eglandular, scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes or comprising only a few spikelets. Racemes 1, single, bearing few fertile spikelets, bearing 2–4 fertile spikelets on each. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–12 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear or lanceolate, 15–65 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, chartaceous. Lower glume apex acute. Upper glume ovate, chartaceous, without keels. Upper glume apex acute, mucronate.

Florets. Fertile lemma ovate, 10–13 mm long, chartaceous, without keel, more than 3-veined. Lemma apex acuminate. Palea 9 -veined, 2-keeled but the uppermost without keels. Palea keels ciliolate, adorned above. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, veined. Anthers 6. Stigmas 3. Caryopsis apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China Southeast.
Fujian, Hunan.

Acidosasa chinensis C.D. Chu & C.S. Chao ex Keng f. *J. Bamboo Res.* 1: 31 (1982).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 140).

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From China.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 500–800 cm long, 30–50 mm diam., woody. Culm-internodes terete, thin-walled, 20 cm long, distally glabrous or hispid. Lateral branches dendroid. Branch complement three. Culm-sheaths present, deciduous, brown and purple, obscurely mottled with last colour, hispid, hairy on margins, without auricles, glabrous on shoulders. Culm-sheath ligule ciliolate. Culm-sheath blade lanceolate, 1.5–4.5 cm long. Leaves 2–5 per branch. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs lacking. Leaf-sheath auricles absent. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 11–30 cm long, 20–65 mm wide. Leaf-blade venation with 12–22 secondary veins. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes or comprising only a few spikelets. Racemes 1, single, 10–26 cm long, bearing few fertile spikelets, bearing 3–5 fertile spikelets on each. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 15–40 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 3–18 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 30–100 mm long, 3–6 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 6–7 mm long, glabrous.

Glumes. Glumes several, 4 empty glumes, persistent, similar, shorter than spikelet. Lower glume ovate, 3 mm long, chartaceous, without keels, 3 -veined. Lower glume surface glabrous. Lower glume apex acute. Upper glume ovate, 16 mm long, chartaceous, without keels. Upper glume apex acute, mucronate.

Florets. Fertile lemma ovate, 22 mm long, 9–10 mm wide, chartaceous, shiny, without keel, 17–19 -veined, more than 3-veined. Lemma lateral veins with cross-veins. Lemma surface glabrous. Lemma apex acuminate. Palea 12 mm long. Palea keels eciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 5–6 mm long, glabrous. Anthers 6, 5 mm long, yellow. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China Southeast.
Guangdong.

Acidosasa diffusum Chia. *Flora Hainanica* 4: 538 (1977).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Qiongzong, *East Hainan Exped.* 703 (HT: SCBI) 15 Nov. 1954.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. diffusus*, widely spreading; -issimus, most. Panicle branches very widely spreading.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. Hainan.

Acidosasa edulis (T.H. Wen) T.H. Wen. *J. Bamboo Res.* 7(1): 31 (1988).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Sinobambusa edulis* T.H. Wen, *J. Bamboo Res.*, 3(2): 30 (1984). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Fuzhou: Hua & Xue F83610 (ZJFI holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. edulis*. Young shoots edible.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, 1200 cm long, 60 mm diam., woody. Culm-internodes terete, thin-walled, 25–40 cm long, distally glabrous. Lateral branches dendroid. Branch complement three. Culm-sheaths present, hispid, with dark brown hairs, hairy on margins, auriculate, setose on shoulders, shoulders with straight hairs. Culm-sheath ligule 3–4 mm high, ciliate. Culm-sheath blade linear or lanceolate, reflexed, scabrid. Leaves 4–5 per branch. Leaf-sheaths 50–55 cm long, striately veined, glabrous on surface, outer margin hairy. Leaf-sheath oral hairs lacking. Leaf-sheath auricles absent. Ligule an eciliate membrane, 2 mm long, obtuse. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 11–18 cm long, 17–28 mm wide. Leaf-blade venation with 12–14 secondary veins, with distinct cross veins. Leaf-blade surface glabrous, hairless throughout. Leaf-blade apex attenuate. Flowering specimens unknown.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China Southeast.

Fujian, Jiangxi, Zhejiang.

Acidosasa guangxiensis Q.H. Dai & C.F. Huang. *Bamboo Res.* 1986(3): 64 (1986).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Nanning: Dai & Fuang 8312 (GXFI holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Guangxi Province, China.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 200–300 cm long, 10–20 mm diam., woody. Culm-internodes terete, thin-walled, 16–18 cm long, distally glabrous or pilose. Lateral branches dendroid. Branch complement three. Culm-sheaths present, deciduous, hispid, hairy on margins, auriculate, with 4–5 mm high auricles, with 1 mm wide auricles, setose on shoulders, shoulders with 6–12 mm long hairs. Culm-sheath ligule 2 mm high, ciliate. Culm-sheath blade lanceolate or triangular, scabrid. Leaves 4–8 per branch. Leaf-sheaths glabrous

on surface. Leaf-sheath oral hairs setose, spreading, 4–5 mm long. Ligule an eciliate membrane, 2 mm long, pubescent on abaxial surface. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 10–16 cm long, 15–23 mm wide. Leaf-blade venation with 8–10 secondary veins. Leaf-blade surface glabrous, hairless except near base. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes or comprising only a few spikelets. Racemes 1, single, bearing few fertile spikelets, bearing 3–6 fertile spikelets on each. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 15–30 mm long, glabrous or pubescent, hairy above.

Fertile Spikelets. Spikelets comprising 13–33 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 60–170 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume ovate, 8–10 mm long, chartaceous, without keels. Lower glume surface glabrous or puberulous. Lower glume margins ciliate. Lower glume apex acute. Upper glume ovate, 9–13 mm long, chartaceous, without keels. Upper glume surface glabrous or puberulous. Upper glume margins ciliate. Upper glume apex acute, mucronate.

Florets. Fertile lemma ovate, 13–15 mm long, 6–7 mm wide, chartaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins ciliate. Lemma apex acuminate. Palea 10–12 mm long. Palea keels ciliate. Palea surface pubescent, hairy on back. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 2 mm long, ciliate. Anthers (4–)6, 5 mm long. Stigmas 3. Ovary glabrous. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China Southeast.
Guangxi.

Acidosasa lingchuanensis (C.D. Chu & C.S. Chao) Q.Z. Xie & X.Y. Chen. *Bull. Bot. Res., Harbin* 13(1): 74, f. 1–2 (1993).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online, U. Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *xIndosasa lingchuanensis* C.D. Chu & C.S. Chao, *Acta Phytotax. Sin.*, 21(1): 69 (1983). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Guangxi: Lingchuan, C.D. Chu & C.S. Chao 78001 (HT: NFU).

Illustrations (Books): G. Hegi, *Flora von Mitteleuropa* 1 (1909) (Fig. 192).

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, 200–400 cm long, 20–30 mm diam., woody. Culm-internodes terete, thin-walled, 30–40 cm long, scaberulous, distally pubescent. Lateral branches dendroid. Branch complement three, thinner than stem. Culm-sheaths present, green, hispid, with tawny hairs, hairy on margins, auriculate, with acute auricles, setose on shoulders, shoulders with straight hairs, shoulders with 10–15 mm long hairs. Culm-sheath ligule entire or ciliolate. Culm-sheath blade linear, spreading or reflexed. Leaves 3–5 per branch. Leaf-sheaths outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 6.5–14 cm long, 10–23 mm wide. Leaf-blade venation with 10 secondary veins. Leaf-blade surface glabrous. Leaf-blade apex acuminate.

Inflorescence. Synflorescence bractiferous, scanty, lax, with glumaceous subtending bracts, with axillary buds at base of spikelet, prophyllate below lateral spikelets.

Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 8–12 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 80–110 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 4–5 mm long.

Glumes. Glumes several, persistent, similar, shorter than spikelet.

Florets. Fertile lemma oblong, 10 mm long, 5 mm wide, chartaceous, without keel, 9–11 -veined, more than 3-veined. Palea keels ciliate. Palea apex obtuse. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 6, 5 mm long. Stigmas 3. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China Southeast.
Guangxi.

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Nanun, Hunan Province, China.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms 300–700 cm long, 10–30 mm diam., woody. Culm-internodes terete, thick-walled, 22–28 cm long, distally glabrous. Culm-nodes flush with internodes or swollen, glabrous. Lateral branches dendroid, erect or ascending. Branch complement two or three, in a clump, with subequal branches or 1 branch dominant. Culm-sheaths present, deciduous, coriaceous, glabrous, without auricles, glabrous on shoulders. Culm-sheath ligule 3 mm high, entire. Culm-sheath blade lanceolate, erect or reflexed. Leaves 4–5 per branch. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs lacking. Leaf-sheath auricles absent. Ligule an eciliate membrane, 3 mm long. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 13–26 cm long, 25–50 mm wide. Leaf-blade venation with 14–18 secondary veins, with distinct cross veins. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, comprising 6–8 fertile spikelets. Panicle open, ovate, 18–25 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 10–25 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 7–9 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 30–70 mm long, 3–5 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 6–7 mm long, pubescent.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume ovate, chartaceous, without keels. Lower glume apex acute. Upper glume lanceolate, chartaceous, without keels. Upper glume apex acute.

Florets. Fertile lemma ovate, 15–17 mm long, 9 mm wide, chartaceous, without keel, 13–18 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex acuminate. Palea 12–15 mm long. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 2.5–3 mm long, glabrous. Anthers 6, 5–5.5 mm long. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, China Southeast.
Guangdong, Hunan, Jiangxi, Zhejiang, Chongqing, Sichuan.

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 138).

Derivation (Clifford & Bostock 2007): *L. noto*, mark. Spikelets multi-colored.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 200–300 cm long, 15–20 mm diam., woody. Culm-internodes terete, thin-walled, glaucous. Lateral branches dendroid. Branch complement three. Culm-sheaths present, deciduous, hispid, hairy on margins, auriculate, with obtuse auricles, with 4 mm high auricles, setose on shoulders, shoulders with 7 mm long hairs. Culm-sheath ligule 6 mm high, ciliate. Culm-sheath blade lanceolate, glabrous on surface. Leaves 2–5 per branch. Leaf-sheaths glabrous on surface or pubescent. Leaf-sheath oral hairs ciliate, deciduous. Leaf-sheath auricles falcate. Ligule an eciliate membrane, 4 mm long, erose. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 11–21 cm long, 3–6 mm wide, dark green and mid-green, discolourous with last colour beneath. Leaf-blade venation with 10–14 secondary veins. Leaf-blade surface glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes or comprising only a few spikelets. Racemes 1, single, bearing few fertile spikelets, bearing 3–5 fertile spikelets on each. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–13 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 3–10 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 25–70 mm long, 3–6 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 7 mm long, pubescent.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume ovate, 6–19 mm long, chartaceous, without keels. Lower glume apex acute. Upper glume ovate, 10–18 mm long, chartaceous, without keels. Upper glume surface glabrous. Upper glume apex acute, mucronate.

Florets. Fertile lemma ovate, 16–19 mm long, chartaceous, without keel, 13–19 -veined, more than 3-veined. Lemma lateral veins with cross-veins. Lemma surface pubescent. Lemma apex acuminate. Palea 13–15 mm long. Palea surface pubescent. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 4–5 mm long, glabrous. Anthers 6, 8–12 mm long, yellow. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China Southeast.
Fujian, Jiangxi, Zhejiang.

TYPE from China. **Basionym or Replaced Name:** *Indosasa purpurea* C.J. Hsueh & T.P. Yi, *Acta Phytotax. Sin.*, 21(1): 94 (1983). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Yunnan: Maguang Xian, Laojun, 1100–1650 m, 20 Dec. 1977, T.P. Yi 77333 (HT: SFS).

Recent Synonyms: *Acidosasa dayongensis* T.P. Yi, *Bull. Bot. Res., Harbin* 6(4): 25–26, f. 1 (1986).
Acidosasa hirtiflora Z.P. Wang & G.H. Ye ex C.S. Chao & C.D. Chu, *Acta Phytotax. Sin.* 29(6): 524, f. 4 (1991).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 138).

Derivation (Clifford & Bostock 2007): *L. purple* to reddish. Usually of purple spikelets.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect at the tip, 300–1000 cm long, 20–80 mm diam., woody, 20–22 -noded. Culm-internodes terete, thick-walled, 20–45 cm long, mid-green or purple, distally mealy. Culm-nodes swollen. Lateral branches dendroid. Bud complement 1. Branch complement three. Culm-sheaths present, deciduous, coriaceous, hispid, with tawny hairs, without auricles, glabrous on shoulders. Culm-sheath ligule 1–2 mm high, dentate. Culm-sheath blade lanceolate, demarcated but persistent, erect, glabrous on surface. Leaves

4–7 per branch. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs scanty or lacking. Leaf-sheath auricles absent. Ligule an eciliate membrane, 1.5–4 mm long. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.3–0.8 cm long. Leaf-blades lanceolate, 12–21 cm long, 12–26 mm wide. Leaf-blade venation with 6–14 secondary veins, with distinct cross veins. Leaf-blade surface glabrous or pubescent, sparsely hairy, hairy abaxially. Leaf-blade margins scaberulous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1–3 fertile spikelets. Spikelets solitary. Fertile spikelets sessile or pedicelled. Pedicels present, 0–23 mm long, pubescent, hairy above.

Fertile Spikelets. Spikelets comprising 3–15 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 19–92 mm long, 3–7 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 2–5 mm long, pubescent.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume ovate, 7–11 mm long, chartaceous, without keels. Lower glume surface puberulous. Lower glume apex acute. Upper glume lanceolate, 11–15 mm long, chartaceous, without keels. Upper glume surface puberulous. Upper glume apex acute.

Florets. Fertile lemma ovate, 15–20 mm long, chartaceous, without keel, more than 3-veined. Lemma surface puberulous. Lemma margins ciliate. Lemma apex acute. Palea 6–11 mm long. Palea keels ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, veined, glabrous. Anthers 6, 4–5 mm long, yellow. Stigmas 3. Ovary glabrous. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, China Southeast. Guangxi, Hunan, Jiangxi. Yunnan.

Acidosasa venusta (McClure) Z.P. Wang & G.H. Ye ex C.S. Chao & C.D. Chu. *Acta Phytotax. Sin.* 29(6): 524, f. 6 (1991).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online, U. Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Semiarundinaria venusta* McClure, *Lingnan Univ. Sci. Bull.*, No. 9, 55 (1940). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *H. Fung* 21002 (BG 2396), 28 Dec 1931, China: Kwangtung: Hwa-Hsien District (US3157322; IT: US-3157323, US-43512). This specimen is the living type which was cultivated and collected at the Lingnan Univ. bamboo garden on 23 Feb 1937.

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 141).

Derivation (Clifford & Bostock 2007): L. beautiful, graceful. Mostly a reference to habit.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms 140 cm long, 8.5 mm diam., woody. Culm-internodes terete, thin-walled, distally glabrous or pilose. Culm-nodes with distinct supra-nodal ridge, pubescent. Lateral branches dendroid. Branch complement three, with subequal branches. Culm-sheaths present, glabrous or pilose, with appressed hairs, glabrous on margins or hairy on margins, without auricles, glabrous on shoulders or ciliate on shoulders. Culm-sheath ligule ciliolate. Culm-sheath blade ovate, deciduous, erect or spreading, scabrid. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs scanty or lacking. Leaf-sheath auricles absent. Ligule a ciliolate membrane, pubescent on abaxial surface. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 10–20 cm long, 14–26 mm wide. Leaf-blade venation with obscure cross veins. Leaf-blade surface glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, 11–15 cm long, bearing few fertile spikelets, bearing 3–4 fertile spikelets on each. Spikelets ascending or pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, 10–30 mm long, puberulous.

Fertile Spikelets. Spikelets with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 6 mm long, scaberulous, pubescent, hairy at tip.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume ovate, 4–6 mm long, chartaceous, 1-keeled, keeled above. Lower glume surface smooth or scabrous, rough above. Lower glume apex acute. Upper glume lanceolate or ovate, 5–8 mm long, chartaceous, 1-keeled, keeled above. Upper glume surface smooth or scabrous, rough above. Upper glume apex acute.

Florets. Fertile lemma oblong or ovate, 13 mm long, chartaceous, without keel, more than 3-veined. Lemma lateral veins with cross-veins. Lemma surface hispidulous. Lemma margins ciliolate, hairy above. Lemma apex acute or acuminate. Palea 1 length of lemma. Palea keels approximate, ciliolate, adorned above. Palea surface puberulous, hairy on margins. Palea apex obtuse. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, ciliate. Anthers 6. Stigmas 3. Ovary glabrous. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China Southeast.
Guangdong.

Aconisia grande (Hitchcock & Chase) J.R.Grande. *Phytoneuron* 22: 2 (2014).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Panama. **Basionym or Replaced Name:** *Panicum grande* Hitchcock & Chase, *Contrib. US. Nat. Herb.* 17: 529 (1915). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A.S. Hitchcock 9178 [= *Amer. Grass Natl. Herb.* 545], 15 Dec 1911, Panama: Canal Zone: in the water of a swamp along the margin of Gatun Lake (US-693329, US-693330, US-693331; IT: F, G, ISC, K, LL, MO-848738, NY, P, SI, W).

Derivation (Clifford & Bostock 2007): L. tall. Plants robust with tall culms.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Panicinae.

Habit, Vegetative Morphology. Perennial. Stolons absent or present. Culms decumbent, robust, 200–400 cm long, 10–15 mm diam., rooting from lower nodes. Culm-nodes pubescent. Leaf-sheaths glabrous on surface. Ligule a ciliolate membrane, 1–2.5 mm long. Leaf-blades elliptic, 35–75 cm long, 30–50 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 55–70 cm long, 25–40 cm wide, contracted about secondary branches. Primary panicle branches ascending or spreading, whorled at most nodes. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, acute, 2.5–2.9 mm long, falling entire.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 1.6–2 mm long, 0.66 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 2–2.5 mm long, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, ovate, 2–2.5 mm long, 1 length of spikelet, membranous, 5 -veined, acute. Fertile lemma elliptic, dorsally compressed, 1.5–1.8 mm long, indurate, shiny, without keel. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Anthers 3, 0.7–1.1 mm long, purple. Caryopsis ellipsoid or oblong, 0.9–1.1 mm long, grey.

$2n = 20$ (1 ref TROPICOS).

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Gulf (Mexico), Southeast Mexico. **Mesoamerica, Caribbean, Northern South America, Western South America, Brazil.** Costa Rica, Guatemala, Honduras, Panama.

Cuba, Trinidad-Tobago. French Guiana, Guyana, Surinam, Venezuela. Bolivia, Colombia, Ecuador, Peru. Brazil North.
Pará. Veracruz. Chiapas, Tabasco.

Acostia gracilis Swallen. *Bol. Soc. Argent. Bot.* 12: 109 (1968).

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Acosta-Solms 12131*, 22 Apr 1949, Ecuador: Imbabura: banks of the rmo Lita, 501 m (US-2078973).

Illustrations (Books): G.Harling & C.Persson, *Flora of Ecuador* (2006) (78: 112, Fig. 5 (2006)).

Derivation (Clifford & Bostock 2007): L. slender. Culms or inflorescences slender.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 25–40 cm long. Ligule a ciliate membrane. Leaf-blades 7–13 cm long, 3–4 mm wide. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 3–4, borne along a central axis, unilateral, 3–4.5 cm long. Central inflorescence axis 7–12 cm long. Rhachis angular. Spikelets solitary or in pairs. Fertile spikelets pedicelled, 1–2 in the cluster. Pedicels present, linear, unequal, scabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, acuminate, 2–2.5 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume lanceolate, membranous, without keels, 5 -veined. Upper glume surface pubescent. Upper glume apex acuminate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, lanceolate, 1 length of spikelet, membranous, 5 -veined, pubescent, acuminate. Fertile lemma elliptic, 1.7 mm long, coriaceous. Lemma margins involute. Lemma apex obtuse. Palea coriaceous.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Ecuador.

Acrachne henrardiana (Bor) S.M. Phillips. *Kew Bull.* 37(1): 158 (1982).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960) (as *Dactyloctenium*).

TYPE from India. **Basionym or Replaced Name:** *Dactyloctenium henrardianum* Bor, *Blumea*, *Suppl.* 3, 44 (1946). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Daniel & S.R. Raju 20089*, India: Madras (K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Jan Theodor Henrard (1881–1974) Dutch botanist.

Classification. Subfamily Chloridoideae. Tribe: Cynodonteae.

Habit, Vegetative Morphology. Culms 10–40 cm long, rooting from lower nodes. Ligule an eciliate membrane, 2 mm long. Leaf-blades 10–20 cm long, 3–7 mm wide, flaccid. Leaf-blade surface pilose, sparsely hairy, hairy abaxially.

Inflorescence. Inflorescence composed of racemes. Racemes 6–15, borne along a central axis, in several whorls, unilateral, 1–1.5 cm long. Central inflorescence axis 4–8 cm long. Rhachis angular, terminating in a sterile spikelet. Spikelet packing broadside to rhachis, regular, 2 -rowed. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Apical sterile spikelets rudimentary, 1 in number.

Fertile Spikelets. Spikelets comprising 2–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 2–3 mm long, 2 mm wide, breaking up at maturity, rhachilla persistent, retaining paleas.

Glumes. Glumes deciduous, similar, shorter than spikelet. Lower glume ovate, 1.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume oblong, 1.5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acuminate, awned, 1 -awned, awn 1 mm long.

Florets. Fertile florets recurved at tip. Fertile lemma ovate, laterally compressed, ovate in profile, 1.5 mm long, membranous, keeled, 3 -veined, 0–3 -veined. Lemma midvein scaberulous. Lemma lateral veins stopping well short of apex. Lemma apex entire, acute, awned, 1 -awned. Principal lemma awn 0.5 mm long overall. Palea ovate, bowed outwards, 0.8 length of lemma, 2 -veined. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 0.3 mm long. Stigmas 2. Caryopsis with free soft pericarp, ellipsoid, isodiametric, biconvex, estipitate, sulcate on hilar side, 0.6 mm long, rugose, apex unappendaged. Embryo 0.3–0.5 length of caryopsis. Hilum punctiform. Endosperm farinose.

Distribution (TDWG). **Continent.** Tropical Asia.

Country /Province /State. **Indian Subcontinent.** India.

Assam. Tamilnadu. Himachal Pradesh, Jammu Kashmir, Uttaranchal.

Acrachne perrieri (A. Camus) S.M. Phillips. *Kew Bull.* 37(1): 158 (1982).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. **Basionym or Replaced Name:** *Dactyloctenium perrieri* A.Camus, *Bull. Soc. Bot. France*, 75: 913 (1929). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: IST: *Perrier de la Bathie 14665*, Madagascar: dunes pres de Majunga (K). IST: *Perrier de la Bathie 17975*, Madagascar: dunes au nord de Majunga (K, US-1445131 (fragm.)).

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (176, Fig.61 as *Camusia*).

Derivation (Clifford & Bostock 2007): in honor of Joseph Marie Henri Alfred Perrier de la Bbthie (1872–1958) French botanist.

Classification. Subfamily Chloridoideae. Tribe: Cynodonteae.

Habit, Vegetative Morphology. Caespitose. Culms 10–40 cm long. Ligule a ciliolate membrane. Leaf-blades involute, 3–10 cm long, 0.5–1.5 mm wide. Leaf-blade surface pilose, sparsely hairy, hairy abaxially.

Inflorescence. Inflorescence composed of racemes. Racemes 2–6, digitate or borne along a central axis, unilateral, 1.5–6 cm long. Central inflorescence axis 0.5–3 cm long. Rhachis flattened, terminating in a sterile spikelet or barren extension, extension subulate. Spikelet packing broadside to rhachis, regular, 1 -rowed. Spikelets appressed, solitary. Fertile spikelets sessile.

Sterile Spikelets. Apical sterile spikelets rudimentary, 1 in number.

Fertile Spikelets. Spikelets comprising 3–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3–6 mm long, breaking up at maturity, rhachilla persistent, retaining paleas. Rhachilla internodes eventually visible between lemmas.

Glumes. Glumes deciduous, similar, shorter than spikelet, recurved at apex. Lower glume lanceolate, 1.5 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate, mucronate. Upper glume ovate, 2 mm long, 0.8–1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex setaceously acuminate.

Florets. Fertile florets recurved at tip. Fertile lemma oblong, laterally compressed, oblong in profile, 2–2.5 mm long, membranous, keeled, 3 -veined, 0–3 -veined. Lemma midvein scaberulous. Lemma lateral veins extending close to apex. Lemma apex entire, acuminate, awned, 1 -awned. Principal lemma awn 0.3–0.9 mm long overall. Palea bowed outwards, 0.8 length of lemma, 2 -veined. Palea keels scabrous. Palea apex acute. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1 mm long. Stigmas 2. Caryopsis with free soft pericarp, ellipsoid, laterally compressed, estipitate, without sulcus, 0.5–0.7 mm long, smooth or granular, apex unappendaged. Embryo 0.33 length of caryopsis. Hilum punctiform. Endosperm farinose.

Distribution (TDWG). **Continent.** Africa.

Country /Province /State. **Western Indian Ocean.** Madagascar.

Derivation (Clifford & Bostock 2007): *L. racemus*, stalk of a cluster of grapes; *-osa*, abundance. The spikelets are borne in racemes or contracted panicles.

Classification. Subfamily Chloridoideae. Tribe: Cynodonteae.

Habit, Vegetative Morphology. Caespitose. Basal innovations intravaginal. Culms 15–75 cm long, 1–3 mm diam., 2–5 -noded. Lateral branches sparse. Leaves cauline. Leaf-sheaths as wide as blade at the collar, keeled. Ligule a ciliolate membrane, 0.5–1.25 mm long. Leaf-blades 15–75 cm long, 5–11.5 mm wide. Leaf-blade surface smooth, glabrous or pilose, sparsely hairy. Leaf-blade margins cartilaginous. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence composed of racemes. Racemes 3–25, digitate or borne along a central axis, in several whorls, unilateral, 1.5–10 cm long. Central inflorescence axis 0–15 cm long. Rhachis angular, terminating in a sterile spikelet. Spikelet packing broadside to rhachis, regular. Spikelets appressed, solitary or in pairs. Fertile spikelets sessile, 1–2 in the cluster. Pedicels absent.

Sterile Spikelets. Apical sterile spikelets rudimentary, 1 in number.

Fertile Spikelets. Spikelets comprising 6–25 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 5.5–13 mm long, 2.5–3 mm wide, breaking up at maturity, rhachilla persistent, retaining paleas, tough throughout or fragile above, with the distal florets falling as a whole. Rhachilla internodes 0.1 mm long, eventually visible between lemmas.

Glumes. Glumes deciduous, similar, shorter than spikelet. Lower glume lanceolate, 1.2–2.9 mm long, 0.5–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate, mucronate. Upper glume ovate, 1.5–3 mm long, 0.5–0.7 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex entire, acuminate, mucronate.

Florets. Fertile florets recurved at tip. Fertile lemma ovate, laterally compressed, ovate in profile, 2.1–2.8 mm long, membranous, yellow to mid-green, keeled, 3 -veined, 0–3 -veined. Lemma midvein scaberulous. Lemma lateral veins excurrent. Lemma apex entire, acute, awned, 1 -awned. Principal lemma awn 0.3–0.9 mm long overall. Palea ovate, bowed outwards, 0.8 length of lemma, 2 -veined. Palea keels scabrous. Palea apex dentate, 2 -fid, acute. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 0.4 mm long. Stigmas 2, protandrous, laterally exerted. Caryopsis with free soft pericarp, ellipsoid, isodiametric, biconvex, estipitate, sulcate on

hilar side, 0.8–1 mm long, rugose, apex unappendaged. Embryo 0.4 length of caryopsis. Hilum punctiform. Endosperm farinose.

$n = 18$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa, Temperate Asia, Tropical Asia, Australasia, North America.

Country /Province /State. Northern Africa, Macaronesia, West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa. Egypt. Cape Verde. Mali, Senegal. DRC. Chad, Eritrea, Ethiopia (inc. Eritrea), Socotra, Somalia, Sudan. Kenya, Tanzania. Angola, Malawi, Mozambique, Zambia, Zimbabwe. Acritochaete volkensis Pilger. *Engl. Jahrb.* 2: 54 (1902).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Tanzania. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ost-Afrika am Kilimandscharo, im Gurtelwald oberhalt Marangu verbreitet, 2100 m.s.m., *Volkens 1278* (HT: B?; IT: K).

Illustrations (Books): H.Jacques-Felix, *Les Graminees d'Afrique tropicale* (1962) (231, Fig. 156), R.M.Polhill, F.T.E.A., *Gramineae* 3(1982):659, Fig. 149), S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (245, Fig. 99), R.Pilger, *Die Natürlichen Pflanzenfamilien* 14e (1940) (46, Fig. 24).

Derivation (Clifford & Bostock 2007): in honor of Georg Ludwig August Volkens (1855–1917) German botanist.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Incertae Sedis.

Habit, Vegetative Morphology. Annual. Culms decumbent, 30–60 cm long, rooting from lower nodes. Ligule an eciliate membrane. Leaf-blades linear to lanceolate, 3–14 cm long, 4–15 mm wide.

Inflorescence. Inflorescence composed of racemes. Racemes 2–4, borne along a central axis, distant, unilateral, 3–9 cm long. Central inflorescence axis 5–15 cm long. Rhachis angular. Spikelet packing adaxial, irregular. Spikelets ascending, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5–6.5 mm long, falling entire.

Glumes. Glumes dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 0.5–1.5 mm long, 0.1–0.25 length of spikelet, membranous, without keels, 0 -veined. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume lanceolate, 4.5–5.5 mm long, membranous, without keels, 3 -veined. Upper glume surface setose, with tubercle-based hairs. Upper glume apex acuminate, awned, 1 -awned, awn 10–20 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, lanceolate, 1 length of spikelet, membranous, setose, with tubercle-based hairs, acuminate, awned. Awn of lower sterile floret flexuous (tangled), 10–30 mm long. Fertile lemma lanceolate, 4.5–5.5 mm long, chartaceous, much thinner on margins, without keel, 5 -veined, more than 3-veined. Lemma margins flat, covering most of palea. Lemma apex acuminate, muticous or awned, 1 -awned. Principal lemma awn 1–2 mm long overall. Palea chartaceous, without keels.

Flower and Fruit. Caryopsis with adherent pericarp, oblong.

$2n = 18$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa. Nigeria. Cameroon, DRC. Ethiopia (inc. Eritrea), Sudan. Kenya, Tanzania, Uganda.

Acroceras amplexens Stapf. Prain, *Fl. Trop. Afr.* 9: 625 (1920).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mali. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: French Sudan: Middle Niger; Koulikoro, *Chevalier*, 2187 ST: *Lecard 246*, Mali (K). ST: *Chevalier 5574*, Central African Republic (P).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. amplexo*, encircle. Leaf-blades more or less heart-shaped.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Annual. Culms decumbent, weak, 30–100 cm long, rooting from lower nodes. Ligule an eciliate membrane or absent. Leaf-blade base cordate or amplexicaul. Leaf-blades linear, 4–20 cm long, 3–10 mm wide. Leaf-blade venation without cross veins or with obscure cross veins.

Inflorescence. Inflorescence composed of racemes. Racemes 4–6, borne along a central axis, distant, unilateral, 3–12 cm long. Central inflorescence axis 10–30 cm long. Rhachis angular, glabrous on surface. Spikelet packing lax, irregular. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, linear, angular, unequal.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, subterete, 4.5–6 mm long, falling entire. Spikelet callus glabrous, base truncate.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 0.5–0.8 length of spikelet, herbaceous, without keels, keel-less except near apex, 3 -veined. Lower glume apex acuminate. Upper glume ovate, 1 length of adjacent fertile lemma, herbaceous, 5 -veined. Upper glume apex laterally pinched.

Florets. Basal sterile florets 1, male or barren, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of fertile lemma, herbaceous, 5 -veined, laterally pinched at apex. Fertile lemma oblong, dorsally compressed, 4–5.5 mm long, indurate, pallid, more than 3-veined. Lemma margins involute. Lemma apex apiculate, with a little green crest. Palea reflexed at apex, elliptic, involute, 1 length of lemma, indurate, 2 -veined, without keels.

Flower and Fruit. Anthers 3, 2 mm long. Caryopsis with adherent pericarp, oblong, dorsally compressed, plano-convex, pallid. Embryo 0.4–0.5 length of caryopsis. Hilum linear, 1 length of caryopsis.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa. Burkina, Gambia, Ghana, Mali, Nigeria, Senegal, Sierre Leone, Togo. Central African Republic, DRC. Sudan. Tanzania, Uganda.

Acroceras attenuatum S.A. Renvoize. *Kew Bull.* 34 (3): 556 (1980).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Tanzania. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Tanzania: Moshi District: Kibibi, *Renvoize & Abdallah 1446* (HT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. thin*. Spikelets terete or narrow.or panicles narrow;.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Annual. Culms prostrate, 20–40 cm long, rooting from lower nodes. Ligule an eciliate membrane. Leaf-blades linear or lanceolate, tapering towards sheath, 5–18 cm long, 5–20 mm wide. Leaf-blade venation with obscure cross veins. Leaf-blade surface glabrous or pubescent. Leaf-blade apex acuminate, filiform.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic or oblong, 6–12 cm long, contracted about primary branches. Primary panicle branches appressed or ascending, 2–6 cm long, bearing spikelets

almost to the base. Panicle branches angular. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, fused to each other, united below, linear, angular, unequal.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 3–3.5(–4) mm long, falling entire. Spikelet callus glabrous, base truncate. Rhachilla internodes elongated between glumes.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.75 length of spikelet, herbaceous, black, without keels, 3 -veined. Lower glume apex acute. Upper glume elliptic, 1 length of adjacent fertile lemma, herbaceous, black, 3 -veined. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of fertile lemma, herbaceous, 3 -veined, obtuse. Fertile lemma elliptic, dorsally compressed, 2.5–3.5 mm long, indurate, pallid, shiny, more than 3-veined. Lemma margins involute. Lemma apex acute, with a little green crest or with a green spot. Palea reflexed at apex, elliptic, involute, 1 length of lemma, indurate, 2 -veined, without keels.

Distribution (TDWG). Continent. Africa.

Country /Province /State. East Tropical Africa, South Tropical Africa. Kenya, Tanzania, Uganda, Mozambique.

Acroceras calcicola A. Camus. *Bull. Mus. Hist. Nat. (Paris)* ser. 2 25: 343 (1953).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madagascar Sud-Ouest: Manampetsa, en sol calcaire, dans le bush, *Perrier de la Bathie, 19112*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *calx*, lime. Grwng on limestone.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Annual. Culms erect, 30–35 cm long. Culm-internodes striate. Culm-nodes pubescent. Leaf-sheaths striately veined, hirsute, with tubercle-based hairs. Ligule a ciliolate membrane. Leaf-blades lanceolate, 2–3 cm long, 4–5 mm wide. Leaf-blade venation prominent, with 6 secondary veins, without cross veins. Leaf-blade surface puberulous, densely hairy. Leaf-blade margins scaberulous, tuberculate-ciliate, hairy at base. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Racemes 4–5, borne along a central axis, unilateral, 3–3.5 cm long. Spikelets in pairs. Fertile spikelets pedicelled. Pedicels present, 1.8–2 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, laterally compressed, 2.2 mm long, falling entire.

Glumes. Glumes dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, clasping, 1.1 mm long, 0.5 length of spikelet, herbaceous, without keels, 3 -veined. Lower glume surface puberulous. Lower glume apex obtuse. Upper glume ovate, 2.2 mm long, 1 length of spikelet, herbaceous, without keels, 5 -veined. Upper glume surface puberulous. Upper glume apex laterally pinched.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, herbaceous, puberulous, obtuse. Fertile lemma ovate, dorsally compressed, 1.6–1.7 mm long, indurate, shiny. Lemma margins involute. Lemma apex acute, mucronate. Palea involute, 1 length of lemma, indurate.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Acroceras chaseae F.O. Zuloaga & O. Morrone. *Darwiniana* 28: 198 (1988).

Illustrations (Journals): *Darwiniana* (28: 201, Fig. 2 (1987)).

Derivation (Clifford & Bostock 2007): in honor of Mary Agnes Merrill Chase (1869–1963) United States agrostologist.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, 50–100 cm long, rooting from lower nodes. Leaf-sheaths 2–4 cm long, pilose. Ligule an eciliate membrane or a ciliolate membrane, 2–4 mm long. Leaf-blade base broadly rounded, symmetrical or asymmetrical. Leaf-blades lanceolate, 8–12 cm long, 12–20 mm wide. Leaf-blade surface glabrous or pilose.

Inflorescence. Inflorescence a panicle or composed of racemes. Panicle open, ovate, 7–20 cm long, 3–17 cm wide, contracted about primary branches. Panicle branches angular, scabrous. Racemes 3–8, borne along a central axis, unilateral, secondarily branched. Rhachis angular. Spikelet packing distant, irregular. Spikelets ascending, solitary or in pairs. Fertile spikelets pedicelled. Pedicels present, linear, angular, unequal, 2–7 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 4.2–4.7 mm long, 1.4–1.6 mm wide, falling entire. Spikelet callus square, glabrous, base truncate. Rhachilla internodes elongated between glumes.

Glumes. Glumes dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 2.1–2.5 mm long, 0.5 length of spikelet, herbaceous, without keels, 3–5 -veined. Lower glume surface pilose, hairy at apex. Lower glume apex obtuse. Upper glume elliptic, 3.6–4 mm long, 0.8–0.9 length of spikelet, herbaceous, 5 -veined. Upper glume surface pilose, hairy at apex. Upper glume apex obtuse.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, herbaceous, 5 -veined, pilose, hairy at apex, obtuse. Fertile lemma elliptic, dorsally compressed, 3.5–4 mm long, 1.2–1.4 mm wide, indurate, pallid. Lemma margins involute. Lemma apex acute, pubescent or with a little green crest. Palea reflexed at apex, elliptic, involute, 1 length of lemma, indurate, 2 -veined. Palea apex pubescent or with green spots.

Acroceras diffusum L.C. Chia. *Fl. Hainan.*, 4: 538 (1977).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006) (as *Setiatis*).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Hainan, Qiongzong: East Hainan Exped. 793.

Recent Synonyms: *Setiatis diffusa* (Chia) S.L. Chen & Y.X. Jin, *Acta Phytotax. Sin.*, 26(3): 219 (1988).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 723 as *Setiatis diffusa*).

Derivation (Clifford & Bostock 2007): L. widely spreading. Inflorescence an open panicle.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, 60–100 cm long, rooting from lower nodes. Culm-nodes glabrous. Ligule a ciliolate membrane. Leaf-blades linear or lanceolate, 5–20 cm long, 5–20 mm wide. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle 15–20 cm long. Primary panicle branches ascending, sparsely divided. Spikelets ascending, solitary or in pairs. Fertile spikelets pedicelled. Pedicels present, linear, angular, unequal.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 3.2 mm long, falling entire.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.66 length of spikelet, herbaceous, without keels, 5–7 -veined. Lower glume apex acute. Upper glume ovate, 1 length of spikelet, herbaceous, 9–11 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, herbaceous, 11 -veined, ciliolate on margins, acute. Palea of lower sterile floret membranous, pilose, adorned on keels. Fertile lemma elliptic, dorsally compressed, 3.2 mm long, coriaceous. Lemma margins involute. Lemma apex acute, pubescent. Palea coriaceous, 2 -veined. Palea apex pubescent.

Flower and Fruit. Lodicules 2, veined. Anthers 3. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. Hainan.

Acroceras elegans A. Camus. *Bull. Soc. Bot. France*, 102: 121 (1955).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Reunion. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Reunion, Saint Denis: Coll? (P holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. elegant*. Inflorescence attractive.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Annual. Culms erect, 25–40 cm long. Culm-internodes distally glabrous. Culm-nodes glabrous. Leaf-sheaths mostly shorter than adjacent culm internode, striately veined, hirsute, with tubercle-based hairs. Ligule an eciliate membrane. Leaf-blades lanceolate, 2.5–4 cm long, 4–6 mm wide. Leaf-blade surface puberulous, hairy abaxially. Leaf-blade margins ciliate. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Racemes 8–9, borne along a central axis, unilateral. Spikelets in pairs. Fertile spikelets pedicelled. Pedicels present, 1.5–1.7 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets obovate, laterally compressed, 1.5–1.7 mm long, falling entire.

Glumes. Glumes dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 0.8–0.9 mm long, 0.5 length of spikelet, herbaceous, without keels, 3 -veined. Lower glume surface rugose. Lower glume apex acute, mucronate. Upper glume ovate, 1.5–1.7 mm long, 1 length of spikelet, herbaceous, without keels, 5 -veined. Upper glume surface rugose, puberulous. Upper glume mucronate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, lanceolate, 1 length of spikelet, herbaceous, acute, mucronate. Fertile lemma oblanceolate, dorsally compressed, 1.5 mm long, indurate, pallid, shiny. Lemma margins involute. Lemma apex acute, mucronate. Palea involute, 1 length of lemma, indurate.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Reunion.

Acroceras excavatum (Henrard) F.O. Zuloaga & O. Morrone. *Darwiniana* 28: 195 (1988).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Paraguay. **Basionym or Replaced Name:** *Panicum excavatum* Henrard, Fedde, *Repert.* 23: 179 (1926). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *B. Balansa* 2947, 1881, Paraguay: Guarapm, in silvis (L; IT: G, K, P, US-1445764 (fragm. ex G,P), US-80624 (fragm. ex L)).

Recent Synonyms: *Panicum excavatum* Henrard, Fedde, *Repert.* 23: 179 (1926).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (258), S.A.Renvoize, *The Grasses of Bahia*, 1984 (130, as Fig. 45 as *Panicum excavatum*), L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (703, Fig 150 as *Panicum excavatum*), F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (12, Fig. 1).

Derivation (Clifford & Bostock 2007): *L. hollowed out*.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, 100–200 cm long. Culm-internodes 3–11 cm long. Culm-nodes brown, glabrous. Lateral branches sparse. Leaf-sheaths 4–7 cm long, glabrous on surface or pubescent, with tubercle-based hairs, outer margin hairy. Ligule an eciliate membrane, 2–4.5 mm long, brown, pubescent on abaxial surface, truncate. Leaf-blade base simple. Leaf-blades linear or lanceolate, 15–20 cm long, 12–16 mm wide. Leaf-blade midrib conspicuous. Leaf-blade surface glabrous or pilose, sparsely hairy, hairy on both sides. Leaf-blade margins scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 20–40 cm long, 10–30 cm wide. Primary panicle branches bearing spikelets almost to the base. Panicle axis scabrous. Spikelets solitary or in pairs. Fertile spikelets pedicelled. Pedicels present, filiform, 5–15 mm long, pubescent.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 3.3–3.8 mm long, 1.3–1.6 mm wide, falling entire. Spikelet callus square, 0.3 mm long, base truncate.

Glumes. Glumes dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, clasping, 1.7–2.1 mm long, 0.5 length of spikelet, membranous, without keels, 3 -veined. Lower glume surface smooth or asperulous, glabrous or pubescent. Lower glume apex obtuse. Upper glume elliptic, 2.8–3.5 mm long, 0.9 length of spikelet, membranous, 5 -veined. Upper glume surface asperulous, rough on veins. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, oblong, 3.1–3.6 mm long, 1 length of spikelet, membranous, 5 -veined, obtuse. Fertile lemma elliptic, dorsally compressed, 2.9–3.5 mm long, 1.2–1.6 mm wide, indurate, dark brown. Lemma surface papillose. Lemma margins involute. Lemma apex obtuse, pubescent or with a shallow excavation or with a green spot. Palea elliptic, involute, 1 length of lemma, indurate. Palea apex pubescent.

Flower and Fruit. Caryopsis with adherent pericarp, ellipsoid, 2.1 mm long, dark brown. Embryo 0.5 length of caryopsis. Hilum punctiform.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America, Brazil, Southern South America. Venezuela. Bolivia. Brazil West Central, Brazil Northeast, Brazil Southeast, Brazil South. Paraguay.

Mato Grosso, Goiás, Bahia, Minas Gerais, Rio de Janeiro, Espírito Santo, São Paulo Paraná, Catarina, Rio Grande do Sul. Mato Grosso, Goiás. Bahia. Minas Gerais, Rio de Janeiro, São Paulo. Paraná, Rio Grande do Sul, Santa Catarina. Misiones.

Acroceras fluminense (Hackel) F.O. Zuloaga & O. Morrone. *Darwiniana* 28: 197 (1988).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Panicum fluminense* Hack., *Oesterr. Bot. Zeitschr.* 1901, 457. (1901). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: IT: *A.F.M. Glaziou 14397*, 1883, Brazil: Rio de Janeiro: Rio de Janeiro (P, US-80870 (fragm. ex W), US-1445786 (fragm. ex P), US-1127279 (fragm. ex P, W)).

Illustrations (Journals): *Darwiniana* (28: 199, Fig. 1 (1987)).

Derivation (Clifford & Bostock 2007): *L. fluminea*, relating to a river; -ensis, denoting origin.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, 20–40 cm long, rooting from lower nodes. Lateral branches ample. Ligule an eciliate membrane. Leaf-blades lanceolate, 4–10(–15) cm long, 12–17 mm wide. Leaf-blade surface glabrous or pilose. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 8–10, borne along a central axis, unilateral, 1–5 cm long. Central inflorescence axis 5–6 cm long. Spikelets in pairs. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 2.6–2.8(–3.3) mm long, falling entire. Rhachilla internodes elongated between glumes.

Glumes. Glumes dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 0.5 length of spikelet, membranous, without keels, 3–5 -veined. Upper glume elliptic, 0.9 length of spikelet, membranous, 5 -veined. Upper glume surface pubescent, hairy at apex. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, oblong, 1 length of spikelet, membranous, 5 -veined, glabrous or pubescent, hairy at apex, acute. Fertile lemma elliptic, dorsally compressed, 2.6–2.8(–3.3) mm long, indurate. Lemma margins involute. Lemma apex obtuse, pubescent or with a shallow excavation or with a little green crest. Palea elliptic, involute, 1 length of lemma, indurate. Palea apex pubescent.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. **Western South America, Brazil.** Bolivia. Brazil West Central, Brazil Northeast, Brazil Southeast, Brazil North.

Distrito Federal, Goiás. Maranhão. Pará. Minas Gerais, Rio de Janeiro.

Acroceras hubbardii (A. Camus) Clayton. *Kew Bulletin* 34 (3): 557 (1979) [1980].

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Madagascar. **Basionym or Replaced Name:** *Brachiaria hubbardii* A. Camus, *Bull. Soc. Bot. France* 94: 40 (1947). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Humboldt 1192*, Comoros ST: *Boivin*, Grand Comore ST: *Hildebrandt 1100*, Ile Zanzibar ST: *Waterlot*, Anjouan ST: *Decary*, Tsantsany ST: *Hildebrandt 2985*, Nossi-be ST: *Boivin*, Mayotte ST: *Boivin*, Madagascar: Est. Ste-Marie-de-Madagascar.

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (411, Fig 156 as *Brachiaria hubbardii*).

Derivation (Clifford & Bostock 2007): in honor of Charles Edward Hubbard (1900–1980) English agrostologist.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Annual. Culms prostrate, slender, 5–20 cm long. Ligule a ciliate membrane. Leaf-blades 1–4 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle capitate, ovate, 0.5–1.5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 2–2.3 mm long, falling entire.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5–0.75 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, 5 -veined, acute. Fertile lemma oblong, dorsally compressed, 1.5–2 mm long, indurate, pallid, without keel, more than 3-veined. Lemma margins involute. Lemma apex acute, with a little green crest. Palea reflexed at apex, involute, indurate.

Distribution (TDWG). Continent. Africa.

Country /Province /State. **East Tropical Africa, Western Indian Ocean.** Tanzania. Comoros, Mauritius, Madagascar, Reunion.

Acroceras gabunense (Hack.) W.D. Clayton. *Kew Bull.* 34 (3): 557 (1980).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Gabon. **Basionym or Replaced Name:** *Commelinidium gabunense*, *Commelinidium mayumbense*, *Commelinidium nervosum*

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *O.A.R. Buettner 555*, Sep 1884, Gabon: Sibange (W; IT: US-80666 (fragm.)). Collection date cited as Oct 1884.

Illustrations (Books): H.Jacques-Felix, *Les Graminees d'Afrique tropicale* (1962) (239, Fig. 165 as *Commelinidium nervosum*).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Gabon.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Perennial. Culms rambling, 20–60 cm long, rooting from lower nodes. Ligule an eciliate membrane. Leaf-blades lanceolate or ovate, tapering towards sheath, 2–10 cm long, 10–40 mm wide. Leaf-blade venation with distinct cross veins. Leaf-blade surface glabrous or pubescent. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 3–10, borne along a central axis, unilateral, 2–7 cm long. Central inflorescence axis 3–20 cm long. Rhachis angular, pubescent on surface. Spikelet packing lax, irregular. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, linear, angular, unequal.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, subterete, 4.5–5.5 mm long, falling entire. Spikelet callus glabrous, base truncate. Rhachilla internodes elongated between glumes.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5 length of spikelet, herbaceous, without keels, 5 -veined. Lower glume surface puberulous, hairy at apex. Lower glume apex acute. Upper glume elliptic, 1 length of adjacent fertile lemma, herbaceous, 5 -veined. Upper glume surface puberulous, hairy at apex. Upper glume apex laterally pinched.

Florets. Basal sterile florets 1, barren, with palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of fertile lemma, herbaceous, 5 -veined, laterally pinched at apex. Fertile lemma lanceolate, dorsally compressed, 4–5 mm long, indurate, pallid, shiny, more than 3-veined. Lemma margins involute. Lemma apex acute, pubescent or with a little green crest. Palea reflexed at apex, elliptic, involute, 1 length of lemma, indurate, 2 -veined, without keels.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, East Tropical Africa, South Tropical Africa. Ghana, Ivory Coast, Liberia, Nigeria. Cameroon, Congo, Gabon, DRC. Uganda. Angola.

Acroceras ivohibense A. Camus. *Bull. Soc. Bot. France* 74: 634 (1928).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Madagascar: Pic d'Ivohibe (Bara), *Humbert*, 3315.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Pie d'Ivohibi, Madagascar.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, 40–80 cm long. Ligule an eciliate membrane. Leaf-blades 8–10 cm long, 6–7 mm wide. Leaf-blade surface glabrous or pilose, hairy adaxially or on both sides. Leaf-blade margins ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 5–10, borne along a central axis, unilateral, 0.5–2 cm long. Central inflorescence axis 4–12 cm long. Rhachis angular, glabrous on surface or pilose on surface. Spikelet packing contiguous, irregular. Spikelets ascending, in pairs. Fertile spikelets pedicelled. Pedicels present, linear, angular, unequal.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, laterally compressed, 4–4.5 mm long, falling entire. Spikelet callus glabrous, base truncate.

Glumes. Glumes dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 2–3 mm long, 0.7–0.8 length of spikelet, herbaceous, without keels, 3 -veined. Lower glume apex acute, awned, 1 -awned, awn 1 mm long. Upper glume ovate, 3.5–3.7 mm long, 0.9 length of spikelet, herbaceous, 1-keeled, 5 -veined. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, herbaceous, 5 -veined, laterally pinched at apex. Fertile lemma elliptic, dorsally compressed, 3.5 mm long, indurate, pallid. Lemma margins involute. Lemma apex acute, laterally pinched or with a little green crest. Palea reflexed at apex, elliptic, involute, 1 length of lemma, indurate, 2 -veined.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Acroceras macrum Stapf. Prain, *Fl. Trop. Afr.* 9: 624 (1920).

Images: G.E.Gibbs Russell et al, *Grasses of Southern Africa* (1990);, F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): L. thin. Leaf-blades narrow.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms decumbent, 20–100 cm long. Culm-nodes glabrous. Ligule a fringe of hairs. Leaf-blades linear, parallel-sided or tapering towards tip, flat or convolute, 3–16 cm long, 1–8 mm wide. Leaf-blade venation without cross veins. Leaf-blade surface glabrous or pubescent.

Inflorescence. Inflorescence composed of racemes. Racemes 1–5, borne along a central axis, appressed, unilateral, 2–8 cm long. Central inflorescence axis 5–25 cm long. Rhachis angular, glabrous on surface. Spikelet packing irregular. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, linear, angular, unequal.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, subterete, 4–4.8 mm long, falling entire. Spikelet callus glabrous, base truncate.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5–0.8 length of spikelet, herbaceous, without keels, keel-less except near apex, 3 -veined. Lower glume apex acute. Upper glume elliptic, 1 length of adjacent fertile lemma, herbaceous, without keels, keel-less except near apex, 5 -veined. Upper glume apex laterally pinched.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, oblong, 1 length of fertile lemma, herbaceous, 5 -veined, laterally pinched at apex. Palea of lower sterile floret scabrous. Fertile lemma elliptic, dorsally compressed, 3.5–4.5 mm long, indurate, pallid, more than 3-veined. Lemma margins involute. Lemma apex apiculate, with a little green crest. Palea reflexed at apex, elliptic, involute, 1 length of lemma, indurate, 2 -veined, without keels.

Flower and Fruit. $n = 18$ (1 ref TROPICOS). $2n = 36$ (2 refs TROPICOS).

TYPE from Sri Lanka. **Basionym or Replaced Name:** *Panicum helopus* var. *glabrum* Trimen, nom nud, *Syst. Cat. Fl. Pl. Ceylon* 104 (1885). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *G.H.K. Thwaites CP 3244*, 1857, Sri Lanka (US-1445609 (fragm.)).

Illustrations (Books): H.Duistermaat, *Field Guide to the Grasses of Singapore* (2005) (33, Fig. 19), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 724), G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Fig. 127).

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012)

(Pl 11).

Derivation (Clifford & Bostock 2007): in honor of William Munro (1818–1880) Scots-born British soldier and amateur botanist who collected extensively in India.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Perennial. Stolons present. Culms decumbent or prostrate or rambling, 25–50 cm long, rooting from lower nodes. Culm-internodes smooth, distally glabrous. Leaves cauline. Leaf-sheaths loose (tight towards apex), 1–3 cm long, mostly shorter than adjacent culm internode, striately veined, glabrous on surface, outer margin hairy. Ligule an eciliate membrane, erose, obtuse. Leaf-blade base broadly rounded or cordate. Leaf-blades lanceolate, 3–8 cm long, 4–10 mm wide, glandular. Leaf-blade midrib evident, prominent beneath. Leaf-blade surface scaberulous. Leaf-blade margins scaberulous, tuberculate-ciliate or glabrous (rarely), hairy at base. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 3–4, borne along a central axis, unilateral, 2–4 cm long. Central inflorescence axis 5–8 cm long. Rhachis narrowly winged, angular, smooth on surface, scaberulous on margins. Spikelet packing lax, irregular. Spikelets ascending, solitary or in pairs. Fertile spikelets pedicelled. Pedicels present, linear, angular, unequal, 1–6 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 3–4 mm long, falling entire. Spikelet callus glabrous, base truncate. Rhachilla internodes elongated between glumes.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, clasping, 3.1 mm long, 0.66 length of spikelet, herbaceous, without keels, 5 -veined. Lower glume apex laterally pinched. Upper glume ovate, 3–4 mm long, 1 length of spikelet, herbaceous, 7 -veined. Upper glume apex laterally pinched.

Florets. Basal sterile florets 1, barren, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 3–4 mm long, 1 length of spikelet, herbaceous, 7 -veined, laterally pinched at apex. Fertile lemma ovate, dorsally compressed, 3.3 mm long, indurate, pallid, 3 -veined, 0–3 -veined. Lemma margins involute. Lemma apex apiculate, laterally pinched or with a little green crest. Palea reflexed at apex, elliptic, involute, 1 length of lemma, indurate, 2 -veined. Palea apex lobed.

Flower and Fruit. Lodicules 2, obovate, 0.25 mm long, irregularly toothed. Anthers 2, 1 mm long. $n = 9$ (1 ref TROPICOS). $2n = 18$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. Hainan. Indian Subcontinent, Indo-China, Malesia. Assam, Bangladesh, India, Sri Lanka. Cambodia, Myanmar, Thailand, Vietnam. Borneo, Java, Malaya, Singapore, Philippines, Sulawesi, Sumatra.

Assam, Meghalaya. Kerala.

Acroceras parvulum A. Camus. *Bull. Soc. Bot. France*, 101: 28 (1954).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madagascar: Sud-Est: vallee du Mandrare, affluent de la Monampanily (Sud-Est); montague au S. de Tanandava, foret..., *Humbert 20,486*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. parvus*, small; *-ula*, diminutive. Dwarf in habit.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Annual. Culms decumbent or rambling, weak, 5–10 cm long, rooting from lower nodes. Culm-nodes pubescent. Ligule an eciliate membrane. Leaf-blades 1.7–2.3 cm long, 2.5 mm wide, flaccid. Leaf-blade surface puberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1–3 fertile spikelets. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, linear, angular.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, acute, 2.2–2.6 mm long, falling entire. Spikelet callus glabrous, base truncate.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 1.9–2 mm long, 0.75 length of spikelet, herbaceous, without keels, 3 -veined. Lower glume apex acute.

Upper glume lanceolate, 2.2–2.6 mm long, 1 length of spikelet, herbaceous, 5 -veined. Upper glume apex acute, mucronate.

Florets. Basal sterile florets 1, barren, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, herbaceous, 5 -veined, acute, mucronate. Fertile lemma elliptic, dorsally compressed, 2.3–2.5 mm long, indurate, pallid. Lemma margins involute. Lemma apex acute, with a little green crest. Palea reflexed at apex, elliptic, involute, 1 length of lemma, indurate, 2 -veined.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Acroceras tenuicaule A. Camus. *Bull. Mus. Hist. Nat. (Paris)* ser. 2 25: 343 (1953).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Est: Sainte-Marie de Madagascar (*Boivin no. 1617*), type; environs d'Ambila (cote Est) (*Benoist, no. 825*),.

Illustrations: None found.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Annual. Culms decumbent, 20–30 cm long, rooting from lower nodes. Culm-nodes pubescent. Leaf-sheaths striately veined, outer margin hairy. Ligule a ciliolate membrane. Leaf-blades lanceolate or oblong, 3–4 cm long, 5–7 mm wide. Leaf-blade surface pilose, sparsely hairy. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Racemes 4–5, borne along a central axis, unilateral, 1–2.5 cm long. Spikelets in pairs. Fertile spikelets pedicelled. Pedicels present, 1.2–1.7 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 2.2 mm long, falling entire.

Glumes. Glumes dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, clasping, 1.4–1.7 mm long, 0.66–0.75 length of spikelet, herbaceous, without keels, 3 -veined. Lower glume apex cuspidate, mucous or mucronate. Upper glume lanceolate or ovate, 2.2 mm long, 1 length of spikelet, herbaceous, without keels, 5 -veined. Upper glume surface puberulous. Upper glume apex laterally pinched.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, lanceolate, 1 length of spikelet, herbaceous, pubescent, acute. Fertile lemma ovate, dorsally compressed, 2 mm long, indurate. Lemma margins involute. Lemma apex acute, mucronate. Palea involute, 1 length of lemma, indurate.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Acroceras tonkinense (Balansa) C. E. Hubbard ex Bor. *Indian Forest Rec. n. s. Bot.* 1(3):78 (1938).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*), N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960).

TYPE from Vietnam. **Basionym or Replaced Name:** *Panicum tonkinense* Balansa, *Morot. Journ. de Bot.* 4: 140. (1890). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *B. Balansa 1646*, May 1887, Vietnam: Bois des Environs de Tu-Phap (L, US-1062262). ST: *Balansa 442*, 12 Sep 1885, Vietnam: Quang Ninh, Quang Yen (L).

Recent Synonyms: *Acroceras ridleyi* (Hack.) Stapf ex Ridley, *Fl. Mal. Penins.* 5: 229 (1925).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 724).

Images: H.B.Gilliland et al., *Flora of Malaya Vol. 3 Grasses* (1971);.

Derivation (Clifford & Bostock 2007): L. -ense, denoting origin. From Tonkin, Indo-China.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Perennial. Culms decumbent or rambling, 50–100 cm long, rooting from lower nodes. Culm-nodes pubescent. Leaf-sheaths 4–6 cm long, outer margin hairy. Ligule a ciliolate membrane. Leaf-blade base cordate. Leaf-blades lanceolate, 5–20 cm long, 5–20 mm wide. Leaf-blade surface scaberulous. Leaf-blade margins cartilaginous.

Inflorescence. Inflorescence composed of racemes. Racemes 5–10, borne along a central axis, unilateral, 3–11 cm long. Central inflorescence axis 8–15 cm long. Rhachis angular. Spikelet packing distant, irregular. Spikelets ascending, in pairs. Fertile spikelets pedicelled. Pedicels present, linear, angular, unequal.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 4.5–5.5 mm long, falling entire. Spikelet callus glabrous, base truncate.

Glumes. Glumes dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume elliptic, clasping, 2.8–3.8 mm long, 0.9 length of spikelet, herbaceous, without keels, 5(–7) -veined. Lower glume apex acute. Upper glume elliptic, 4.2 mm long, 0.8–0.9 length of spikelet, herbaceous, 5 -veined. Upper glume apex laterally pinched.

Florets. Basal sterile florets 1, male or barren, with palea. Lemma of lower sterile floret similar to upper glume, elliptic, 4.5–5.5 mm long, 1 length of spikelet, herbaceous, 5 -veined, laterally pinched at apex. Fertile lemma elliptic, dorsally compressed, 4 mm long, indurate, pallid. Lemma surface striate. Lemma margins involute. Lemma apex acute, with a little green crest. Palea reflexed at apex, elliptic, involute, 1 length of lemma, indurate, 2 -veined.

Flower and Fruit. Anthers 3, 2 mm long.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, Hainan. **Indian Subcontinent, Indo-China, Malasia.** Assam, India. Laos, Myanmar, Thailand, Vietnam. Borneo, Java, Lesser Sunda Is, Malaya, Singapore, Moluccas, Sumatra.

Yunnan. Assam.

Acroceras zizanioides (H. B. & K.) Dandy. *Journ. Bot.* 69: 54 (1931).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*), N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960).

TYPE from Colombia. **Basionym or Replaced Name:** *Panicum zizanioides* Kunth, *Nov. Gen. et Sp.* 1: 100 (1815). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Humboldt & Bonpland 1606*, May, Colombia (B; IT: BM, P).

Illustrations (Journals): *Ruizia* (13:335, Fig 41a-c (1993)).

Derivation (Clifford & Bostock 2007): Gk. *-oides*. Resembling *Zizania*.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Perennial. Culms decumbent (from a prostrate base), 30–100 cm long, 1–2.5 mm diam., 10–20 -noded, rooting from lower nodes. Lateral branches sparse. Leaves cauline. Leaf-sheaths wider than blade at the collar, outer margin hairy. Ligule an eciliate membrane, 0.5 mm long, truncate. Collar pilose. Leaf-blade base broadly rounded. Leaf-blades lanceolate, 4–15 cm long, 6–26 mm

wide. Leaf-blade venation with obscure cross veins. Leaf-blade surface ribbed. Leaf-blade margins cartilaginous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle or composed of racemes (racemes with irregular secondary branching). Panicle open, contracted about primary branches. Primary panicle branches bearing spikelets almost to the base. Panicle branches angular, scaberulous. Racemes 3–10, borne along a central axis, unilateral, 4–12 cm long, secondarily branched. Central inflorescence axis 8–20 cm long. Rhachis angular. Spikelet packing lax, irregular. Spikelets ascending, in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, linear, angular, unequal.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, subterete, 4.5–6.5 mm long, 1.5–2.5 mm wide, falling entire. Spikelet callus glabrous, base truncate.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5–0.8 length of spikelet, herbaceous, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 1 length of adjacent fertile lemma, herbaceous, 5 -veined. Upper glume apex laterally pinched.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of fertile lemma, herbaceous, 5 -veined, laterally pinched at apex. Palea of lower sterile floret hyaline. Fertile lemma elliptic, dorsally compressed, lanceolate in profile, 4–6 mm long, indurate, pallid, 5 -veined, more than 3-veined. Lemma surface striate, with distinct germination flap. Lemma margins involute. Lemma apex apiculate, with a little green crest. Palea reflexed at apex, elliptic, involute, 1 length of lemma, indurate, 2 -veined, without keels. Palea apex acute.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 2 mm long. Stigmas 2.

$n = 27$ (1 ref TROPICOS). $2n = 36$ (3 refs TROPICOS, 1 as *A. oryzoides*).

Illustrations (Books): S.A.Rennoize, *Gramineas de Bolivia* (1998) (28, Fig. 1), E.J.Judziewicz et al, *American Bamboos* (1999) (149, Fig. 63 & 150, Fig. 64).

Derivation (Clifford & Bostock 2007): L. whorl; -ata, possessing. Primary inflorescence branches whorled.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 300–460 cm long, 7–14 mm diam., woody. Culm-internodes terete, thick-walled, distally pruinose. Lateral branches dendroid. Branch complement many, flabellate, with subequal branches, thinner than stem. Culm-sheaths present, deciduous, glabrous, auriculate, ciliate on shoulders. Culm-sheath blade ovate, constricted at base, spreading, glabrous on surface, acuminate. Leaves cauline, 5–7 per branch. Leaf-sheaths glabrous on surface or pubescent, outer margin glabrous or hairy. Leaf-sheath oral hairs lacking or setose. Ligule an eciliate membrane. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole glabrous. Leaf-blades persistent, lanceolate, 8–13 cm long, 10–13 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle or comprising only a few spikelets, comprising 2–4(–8) fertile spikelets, axillary, bracteate at branch bases. Panicle open, 3–6 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 20–40 mm long, glabrous or puberulous.

Fertile Spikelets. Spikelets comprising 7–10 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, compressed slightly, 60–75 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 5–5.5 mm long, obscured by lemmas, pilose, hairy all along but hairs longer above.

Glumes. Glumes persistent, similar, shorter than spikelet, firmer than fertile lemma. Lower glume ovate, 5.5 mm long, 0.7–0.75 length of upper glume, coriaceous, without keels, 5 -veined. Lower glume apex acute. Upper glume ovate, 7.7 mm long, 0.6–0.7 length of adjacent fertile lemma, coriaceous, without keels, 11 -veined. Upper glume apex acute.

Florets. Fertile lemma ovate, 12 mm long, chartaceous, without keel, 13 -veined, more than 3-veined. Lemma apex acute. Palea 1.1 length of lemma, chartaceous, 18 -veined. Palea keels winged, ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 3–4 mm long, veined, glabrous or ciliate. Anthers 3, 5–9.2 mm long. Stigmas 2. Ovary umbonate, pubescent on apex. Caryopsis with free brittle pericarp, ellipsoid, 11–14.5 mm long. Embryo 0.15 length of caryopsis. Hilum linear, 1 length of caryopsis.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil. Bolivia. Brazil West Central, Brazil Northeast, Brazil Southeast, Brazil North.

Goiás. Distrito Federal, Mato Grosso, Goiás. Bahia. Amazonas. Minas Gerais, Sao Paulo.

Aegilops bicornis (Forssk.) Jaub. & Spach. *Illustr. Pl. Or.* 4: 11 (1851).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Egypt. **Basionym or Replaced Name:** *Triticum bicorne* Forssk., *Fl. Aegypt.-Arab.* 26 (1775)

. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Egypt, Alexandria: Forsskal (C holo).

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 208 as var. *bicornis*), L.Boulos, *Flora of Egypt* 4 (2005) (215, Pl. 61).

Images: L.Boulos, *Flora of Egypt* 4 (2005);.

Derivation (Clifford & Bostock 2007): L. *bi-*, two; *cornus*, horn.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 15–45 cm long. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades flat or involute, 5–10 cm long, 2–2.5 mm wide.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, linear, bilateral, 5–8 cm long, bearing 12–16 fertile spikelets on each. Rhachis fragile at the nodes. Spikelet packing broadside to rhachis. Rhachis internodes oblong, 0.5 length of fertile spikelet, falling with spikelet above. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets rudimentary, 1 in number.

Fertile Spikelets. Spikelets comprising 1–2 fertile florets, with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets, or of 2 or more fertile florets. Spikelets

one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 5.5–8.5 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume oblong, 5–7 mm long, 1 length of upper glume, coriaceous, without keels, 4–6 -veined. Lower glume lateral veins distinct, ribbed. Lower glume apex with a unilateral tooth or dentate, 1–2 -fid. Upper glume oblong, 5–7 mm long, 1.2 length of adjacent fertile lemma, coriaceous, without keels, 4–6 -veined. Upper glume lateral veins distinct, ribbed, parallel at apex. Upper glume apex with a unilateral tooth or dentate, 1–2 -fid.

Florets. Fertile lemma elliptic, 4–6 mm long, coriaceous, keeled, keeled above, 5 -veined, more than 3-veined. Lemma apex entire, awned, 1 -awned. Principal lemma awn 30–60 mm long overall. Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 25–50 cm long. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 2–5 cm long, 1–2 mm wide. Leaf-blade surface pilose, sparsely hairy.

Inflorescence. Inflorescence composed of racemes, deciduous as a whole. Racemes 1, single, linear, smoothly terete, bilateral, 4–11 cm long, bearing few fertile spikelets, bearing (3–)4–7(–9) fertile spikelets on each. Rhachis tough. Spikelet packing broadside to rhachis. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets rudimentary, 2 in number.

Fertile Spikelets. Spikelets comprising 4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 10–12 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume oblong, asymmetrical, 9–10 mm long, 1 length of upper glume, coriaceous, without keels, 7–9 -veined. Lower glume lateral veins unequally thickened, ribbed. Lower glume apex dentate, 2 -fid, awned only on distal spikelets (or shortly awned below), 1 -awned, awn 40–100 mm long. Upper glume oblong, asymmetrical, 9–10 mm long, 0.9 length of adjacent fertile lemma, coriaceous, without keels, 7–9 -veined. Upper glume lateral veins unequally thickened, ribbed, parallel at apex. Upper glume apex dentate, 2 -fid, awned only on distal spikelets (or shortly awned below), 1 -awned, awn 40–100 mm long.

Florets. Fertile lemma oblong, 9–10 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 2 -fid or 3 -fid, muticous. Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

Derivation (Clifford & Bostock 2007): L. thick. Spikes thick.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, 30–50 cm long. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 10–20 cm long, 4–10 mm wide. Leaf-blade surface glabrous or pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, moniliform, smoothly terete, bilateral, 4–8 cm long, bearing 6–8 fertile spikelets on each. Rhachis fragile at the nodes, semiterete. Spikelet packing broadside to rhachis. Spikelets appressed, solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets absent or rudimentary, 0–2 in number.

Fertile Spikelets. Spikelets comprising 3–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 10–14 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume oblong, asymmetrical, 8–10 mm long, 1 length of upper glume, coriaceous, without keels, 7–9 -veined. Lower glume lateral veins unequally thickened, ribbed. Lower glume surface pubescent. Lower glume apex dentate, 2–4 -fid, truncate. Upper glume oblong, asymmetrical, 8–10 mm long, 0.9 length of adjacent fertile lemma, coriaceous, without keels, 7–9 -veined. Upper glume lateral veins unequally thickened, ribbed. Upper glume surface pubescent. Upper glume apex dentate, 2–4 -fid, truncate.

Florets. Fertile lemma oblong, 10–12 mm long, coriaceous, keeled, 5 -veined, more than 3-veined. Lemma apex entire or dentate, 2 -fid, with irregular lobes, truncate, muticous or awned, 1 -awned. Principal lemma awn flat below, 50–80 mm long overall (becoming longer above, but shorter than raceme). Palea 2 -veined. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, ciliate. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

Aegilops juvenalis (Thell.) Eig. *Repert. Spec. Nov. Regni Veg. Beih* 55: 63, 93 (1929).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from France. **Basionym or Replaced Name:** *Triticum juvenale* Thell., *Fedde, Repert. Nov. Sp.* 3: 281 (1907). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: France, Port Juvenale: Touchy (MPU holo, W).

Illustrations (Books): N.L.Bor, *Gramineae in Flora of Iraq* (1968) (183, Pl. 62).

Derivation (Clifford & Bostock 2007): L. -ale, pertaining to. From Port Juvenal, near Montpellier, France.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 20–40 cm long. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 15–30 cm long, 5–10 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, moniliform or lanceolate, bilateral, 4–8 cm long, bearing 6 fertile spikelets on each. Rhachis fragile at the nodes. Spikelet packing

broadside to rhachis. Rhachis internodes oblong, falling with spikelet alongside. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets rudimentary, 1–2 in number.

Fertile Spikelets. Spikelets comprising 4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 10–15 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume elliptic, 7–8 mm long, 1 length of upper glume, coriaceous, without keels, 7–9 -veined. Lower glume lateral veins distinct, ribbed. Lower glume surface pubescent. Lower glume apex dentate, 2 -fid, truncate, awned, 2 -awned, awn 6–12 mm long. Upper glume elliptic, 7–8 mm long, 0.8 length of adjacent fertile lemma, coriaceous, without keels, 7–9 -veined. Upper glume lateral veins distinct, ribbed, parallel at apex. Upper glume surface pubescent. Upper glume apex dentate, 2 -fid, truncate, awned, 2 -awned, awn 6–12 mm long.

Florets. Fertile lemma oblong, 8–9 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 2 -fid, truncate, awned, 1 -awned. Principal lemma awn subterete below, 6 mm long overall. Palea 2 -veined. Palea keels scaberrulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Middle Asia, Western Asia. Turkmenistan, Tadzhikistan, Uzbekistan. Iran, Iraq.

Aegilops kotschy Boiss. *Diagn. Pl. Orient.* 7: 129 (1846).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Iran. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT (1 CT): Th.Kotschy 366, Majo m. 1842, Persia austr.: Ad canales pr. p.Sabst-Buschorum" (LE: 2 sheets of IT).

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 215 as var. *kotschy*).

Images: L.Boulos, *Flora of Egypt* 4 (2005);.

Derivation (Clifford & Bostock 2007): L. -*ana*, indicating connection. In honor of Karl Georg Theodor Kotschy (1813–1866) Austrian botanist and traveller.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, 12–25 cm long. Leaf-sheaths pilose. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 6–12 cm long, 1.5–4 mm wide. Leaf-blade surface glabrous or pilose, sparsely hairy. Leaf-blade margins ciliate.

Inflorescence. Inflorescence composed of racemes, deciduous as a whole. Racemes 1, single, lanceolate, bilateral, 0.5–4 cm long, 2.5–5 mm wide, bearing few fertile spikelets, bearing 2–6 fertile spikelets on each. Rhachis tough. Spikelet packing broadside to rhachis. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets rudimentary, 2–3 in number.

Fertile Spikelets. Spikelets comprising 2 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 7–10 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume oblong or ovate, 4–6 mm long, 1 length of upper glume, coriaceous, without keels, 7–9 -veined. Lower glume lateral veins distinct, ribbed. Lower glume surface scabrous, rough on veins, glabrous or pilose. Lower glume apex dentate, 3 -fid, truncate, awned, 3 -awned, awn 10–30 mm long. Upper glume oblong or ovate, 4–6 mm long, 0.7–0.8 length of adjacent fertile lemma, coriaceous, without keels, 7–9 -veined. Upper glume lateral veins distinct, ribbed, parallel at apex. Upper glume surface scabrous, rough on veins, glabrous or pilose. Upper glume apex dentate, 3 -fid, truncate, awned, 3 -awned, awn 10–30 mm long.

Florets. Fertile lemma oblong, 5–8 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 2 -fid, awned, 1–3 -awned. Principal lemma awn 5–15 mm long overall. Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

$2n = 28$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa, Temperate Asia.

Country /Province /State. Northern Africa. Egypt, Libya, Tunisia. **Middle Asia, Caucasus, Western Asia, Arabian Peninsula.** Turkmenistan, Uzbekistan. Transcaucasus. Afghanistan, Cyprus, Iran, Iraq, Lebanon-Syria, Palestine, Israel & Jordan, Turkey. Gulf States, Kuwait, Saudi Arabia.

Aegilops longissima Schweinf. & Muschler. Muschler, *Man. Fl. Egypt* 1: 156 (1912).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Egypt. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Egypt, Alexandria: Schweinfurth (B lecto, CAIM, NPU, US).

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 210), L.Boulos, *Flora of Egypt* 4 (2005) (215, Pl. 61).

Derivation (Clifford & Bostock 2007): *L. longus*, long, -issima, most. Internodes very long.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms geniculately ascending, 40–110 cm long. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades flat or involute, 5–10 cm long, 3 mm wide. Leaf-blade surface glabrous or pilose.

Inflorescence. Inflorescence composed of racemes, not deciduous as a whole or deciduous as a whole. Racemes 1, single, linear, unilateral or bilateral, 10–20 cm long, bearing 10–20 fertile spikelets on each. Rhachis tough or fragile at the nodes. Spikelet packing broadside to rhachis. Rhachis internodes oblong, 1 length of fertile spikelet, when fragile falling with spikelet above. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets absent or rudimentary, 0–1 in number.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 12–14 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume oblong, 7–8 mm long, 1 length of upper glume, coriaceous, without keels, 6–7 -veined. Lower glume lateral veins distinct, ribbed. Lower glume apex dentate or lobed, 2 -fid, muticous or awned or awned only on distal spikelets, 1 -awned, awn 3–10 mm long. Upper glume oblong, 7–8 mm long, 0.8–0.9 length of adjacent fertile lemma, coriaceous, without keels, 6–7 -veined. Upper glume lateral veins distinct, ribbed, parallel at apex. Upper glume apex dentate or lobed, 2 -fid, muticous or awned or awned only on distal spikelets, 1 -awned, awn 3–10 mm long.

Florets. Fertile lemma elliptic, 8–10 mm long, coriaceous, keeled, keeled above, 5 -veined, more than 3-veined. Lemma apex dentate, 1–2 -fid, awned only on distal spikelets, 1 -awned. Principal lemma awn subterete below, 40–60 mm long overall. Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

$n = 7$ (1 ref TROPICOS). $2n = 14$ (5 refs TROPICOS).

Distribution (TDWG). Continent. Africa, Temperate Asia.

Country /Province /State. Northern Africa. Egypt. **Western Asia.** Palestine, Israel & Jordan.

Aegilops lorentii Hochst. Lorent, *Wanderungen* 326 (1845).

Accepted by: T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Turkey. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Turkey, Seleucia: von Lorent (TUB holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of J. August Lorent (1812–1884) American-born German botanist and traveller.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 5–30 cm long. Leaf-sheaths pilose. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 2–5 cm long, 2–3 mm wide. Leaf-blade surface glabrous or pilose.

Inflorescence. Inflorescence composed of racemes, deciduous as a whole. Racemes 1, single, lanceolate, bilateral, 1.5–2 cm long, bearing few fertile spikelets, bearing 2–3(–4) fertile spikelets on each. Rhachis tough. Spikelet packing broadside to rhachis, with upper internodes elongated. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets rudimentary, 1–2 in number.

Fertile Spikelets. Spikelets comprising 4–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 8–11 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume oblong or obovate, 7–10 mm long, 1 length of upper glume, coriaceous, without keels, 7–9 -veined. Lower glume lateral veins unequally thickened, ribbed. Lower glume surface pubescent or pilose. Lower glume apex truncate, awned, 2–3 -awned, awn 20–70 mm long. Upper glume oblong or obovate, 7–10 mm long, 0.9 length of adjacent fertile lemma, coriaceous, without keels, 7–9 -veined. Upper glume lateral veins unequally thickened, ribbed, parallel at apex. Upper glume surface pubescent or pilose. Upper glume apex truncate, awned, 2–3 -awned, awn 20–70 mm long.

Florets. Fertile lemma oblong, 8–11 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 1–2 -fid, awned, 1–2 -awned. Principal lemma awn subterete below, 8–30 mm long overall. Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

Aegilops markgrafii (Greuter) K. Hammer. *Feddes Repert.* 91 (4): 232 (1980).

Accepted by: U. Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Greece. **Basionym or Replaced Name:** *Triticum markgrafii* Greuter, *Boissiera*, 13: 172 (1967). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: : Based on *Aegilops cylindrica* Sm. ; Crete: Sibthorp (OXF lecto).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Friedrich Markgraf (1897–1987) German botanist.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 25–50 cm long. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 2–5 cm long, 1–2 mm wide. Leaf-blade surface pilose, sparsely hairy.

Inflorescence. Inflorescence composed of racemes, deciduous as a whole. Racemes 1, single, linear, smoothly terete, bilateral, 4–11 cm long, bearing few fertile spikelets, bearing (3–)4–7(–9) fertile spikelets on each. Rhachis tough. Spikelet packing broadside to rhachis. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets rudimentary, 2 in number.

Fertile Spikelets. Spikelets comprising 4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 10–12 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume oblong, asymmetrical, 9–10 mm long, 1 length of upper glume, coriaceous, without keels, 7–9 -veined. Lower glume lateral veins unequally

thickened, ribbed. Lower glume apex dentate, 2 -fid, awned only on distal spikelets (or shortly awned below), 1 -awned, awn 40–100 mm long. Upper glume oblong, asymmetrical, 9–10 mm long, 0.9 length of adjacent fertile lemma, coriaceous, without keels, 7–9 -veined. Upper glume lateral veins unequally thickened, ribbed, parallel at apex. Upper glume apex dentate, 2 -fid, awned only on distal spikelets (or shortly awned below), 1 -awned, awn 40–100 mm long.

Florets. Fertile lemma oblong, 9–10 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 2 -fid or 3 -fid, muticous. Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

$2n = 14$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Europe, Temperate Asia.

Region. Southeastern Europe.

Country /Province /State. : Bulgaria, Greece, Crete, Yugoslavia. **Western Asia.** Afghanistan, East Aegean Is, Iraq, Lebanon-Syria, Turkey.

Aegilops mutica Boiss. *Diagn. Pl. Orient.* 15: 73. (1844).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006) (as *Amblyopyrum muticum*), N.Tsvelev, *Grasses of the Soviet Union* (1983) (as *Amblyopyrum muticum*).

TYPE from Turkey. **Basionym or Replaced Name:** *Amblyopyrum muticum* (Boiss.)Eig, *E. Inst. Agric. & Nat. Hist., Agric. Rec.* No. 2, 200 (1929). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Hab. in Cappadocia ad Euphratem, 1837, *Aucher* 2977 (G(herb. Boiss.); IT: G, P).

Illustrations (Books): N.L.Bor, *Gramineae* in K.H.Rechinger, *Flora Iranica*. No. 70/30 (1970) (Tab. 30 as *Amblyopyrum*), N.L.Bor, *Gramineae* in *Flora of Iraq* (1968) (225, Pl. 76 as *Amblyopyrum*).

Derivation (Clifford & Bostock 2007): L. blunt. Lacking awns or lemmas and/or glumes truncate.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, 30–90 cm long. Leaf-sheaths outer margin hairy. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule absent. Leaf-blades 5–10 cm long, 3–5 mm wide. Leaf-blade surface glabrous or pilose, hairy adaxially, with tubercle-based hairs. Leaf-blade margins glabrous or tuberculate-ciliate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, linear, bilateral, 15–18 cm long, bearing 10–20 fertile spikelets on each. Rhachis fragile at the nodes (tardily), semiterete, glabrous on surface or pubescent on surface, scaberulous on margins. Spikelet packing broadside to rhachis. Rhachis internodes linear, 10–17 mm long, falling with spikelet above. Spikelets appressed, solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets absent.

Fertile Spikelets. Spikelets comprising 5–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 8–15 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes collateral, similar, shorter than spikelet. Lower glume oblong, 5–7 mm long, 1 length of upper glume, coriaceous, without keels, 5 -veined. Lower glume lateral veins ribbed. Lower glume surface glabrous or pilose. Lower glume apex entire, emarginate or truncate. Upper glume oblong, 5–7 mm long, 0.9 length of adjacent fertile lemma, coriaceous, without keels, 9 -veined. Upper glume lateral veins ribbed, divergent at apex. Upper glume surface glabrous or pilose. Upper glume apex emarginate or truncate.

Florets. Fertile lemma oblong, 7–10 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface glabrous or pilose, hairy all along or above. Lemma apex emarginate or obtuse, muticous. Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, ciliate. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, oblong, sulcate on hilar side, hairy at apex. Embryo 0.5–0.66 length of caryopsis. Hilum linear, 1 length of caryopsis.

$n = *$, $2n = 28$ (*).

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Caucasus, Western Asia. Transcaucasus. Turkey.

Aegilops neglecta Req. ex Bertol. *Fl. Ital.* 1: 787 (1834).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from France. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: OM: (LE). There are 3 sheets annotated by Requen as *A. neglecta* before publication but not cited there! van Slageren (p. 281, 1994), does not consider these as isotypes.

HT: *Requien misit*, 1833, France: Avignonon (BOLO-BERT; AV, MPU).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (267).

Derivation (Clifford & Bostock 2007): *L. negligo*, disregard. Often a segregate from another species with which confusion is likely.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 25–35 cm long. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 2–6 cm long, 2.5–3 mm wide. Leaf-blade surface pilose. Leaf-blade margins ciliate.

Inflorescence. Inflorescence composed of racemes, deciduous as a whole. Racemes 1, single, obovate, bilateral, 3–6 cm long, bearing few fertile spikelets, bearing 2(–3) fertile spikelets on each. Rhachis tough. Spikelet packing broadside to rhachis. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets rudimentary, 3 in number.

Apical sterile spikelets barren, 1–2 in number.

Fertile Spikelets. Spikelets comprising 2 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 10–11 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume elliptic, gibbous, 9–10 mm long, 1 length of upper glume, coriaceous, without keels, 7–9 -veined. Lower glume lateral veins unequally thickened, ribbed. Lower glume surface pubescent. Lower glume apex awned, 2–3 -awned, awn 20–50 mm long. Upper glume elliptic, gibbous, 9–10 mm long, 0.9 length of adjacent fertile lemma, coriaceous, without keels, 7–9 -veined. Upper glume lateral veins unequally thickened, ribbed, parallel at apex. Upper glume surface pubescent. Upper glume awned, 2–3 -awned, awn 20–50 mm long.

Florets. Fertile lemma oblong, 10–11 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 2–4 -fid, awned, 2–4 -awned. Principal lemma awn 10–25 mm long overall. Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

TYPE from Scotland. **Basionym or Replaced Name:** *Triticum peregrinum* Hack., *Ann. Scot. Nat. Hist.* 1907, 102. (1907). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: J. Fraser, Jul 1906, Scotland: Edinburgh, Leithe Docks (W; IT: US-75309 (ex W)).

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 214 as ssp. *peregrina* & *cylindrostachys*).

Derivation (Clifford & Bostock 2007): L. foreigner.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, 9–13 cm long. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 3–6 cm long, 2–3 mm wide. Leaf-blade surface pubescent, hairy on both sides.

Inflorescence. Inflorescence composed of racemes, deciduous as a whole. Racemes 1, single, lanceolate or ovate, bilateral, 1–2 cm long, bearing few fertile spikelets, bearing 2–7 fertile spikelets on each. Rhachis tough. Spikelet packing broadside to rhachis. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets rudimentary, 2–3 in number.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong or ovate, laterally compressed, 5–7 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume oblong or obovate, 3–5 mm long, 1 length of upper glume, coriaceous, without keels, 7–9 -veined. Lower glume lateral veins distinct, ribbed. Lower glume surface scabrous, rough on veins. Lower glume apex dentate, truncate, awned, 2–3 -awned, awn 9–24 mm long. Upper glume oblong or obovate, 3–5 mm long, 0.66 length of adjacent fertile lemma, coriaceous, without keels, 7–9 -veined. Upper glume lateral veins distinct, ribbed, parallel at apex. Upper glume surface scabrous, rough on veins. Upper glume apex dentate, 2–3 -fid, truncate, awned, 2–3 -awned, awn 9–25 mm long.

Florets. Fertile lemma oblong, 4.5–7.5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma apex entire or erose, emarginate or truncate, muticous or awned only on distal spikelets (shortly), 1 -awned. Principal lemma awn 20–120 mm long overall. Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia.

Region. Southeastern Europe.

Country /Province /State. : Greece, Crete. **Northern Africa.** Algeria, Egypt, Libya, Morocco. **Caucasus, Western Asia, Arabian Peninsula.** Transcaucasus. Cyprus, Iran, Iraq, Lebanon-Syria, Palestine, Israel & Jordan, Turkey.

Aegilops searsii M. Feldman & M. Kislev. *Israel J. Bot.* 26(4): 191 (1978).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Israel. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Israel: Judean Hills, Yattir, Sarcopoterietum spinosi semitepposum, terra rossa mixed with loess, 15 Jun 1976, *Feldman, Kislev & Kushnir s.n.* (HT: HUI; IT: HUI, K).

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 211).

Derivation (Clifford & Bostock 2007): in honor of Ernest R. Sears (-) United States plant breeder and geneticist.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms geniculately ascending, 10–50 cm long. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades flat or involute, 2–5 cm long, 1.5 mm wide.

Inflorescence. Inflorescence composed of racemes, deciduous as a whole, embraced at base by subtending leaf. Racemes 1, single, linear, bilateral, 5–11 cm long, bearing 8–12 fertile spikelets on each. Rhachis tough. Spikelet packing broadside to rhachis. Rhachis internodes oblong, 1 length of fertile spikelet. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets absent or rudimentary, 0–1 in number.

Fertile Spikelets. Spikelets comprising 2 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 12–14 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume oblong, 7–8 mm long, 1 length of upper glume, coriaceous, without keels, 6–7 -veined. Lower glume lateral veins distinct, ribbed. Lower glume apex dentate or lobed, 2 -fid, muticous or awned or awned only on distal spikelets, 1 -awned, awn 3–10 mm long. Upper glume oblong, 7–8 mm long, 0.8–0.9 length of adjacent fertile lemma, coriaceous, without keels, 6–7 -veined. Upper glume lateral veins distinct, ribbed, parallel at apex. Upper glume apex dentate or lobed, 2 -fid, muticous or awned or awned only on distal spikelets, 1 -awned, awn 3–10 mm long.

Florets. Fertile lemma elliptic, 8–10 mm long, coriaceous, keeled, keeled above, 5 -veined, more than 3-veined. Lemma apex dentate, 1–2 -fid, awned only on distal spikelets, 2 -awned. Principal lemma awn from a sinus, subterete below, 80–100 mm long overall. Lateral lemma awns present, arising on apex of lobes, 40–50 mm long. Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Anthers 3, 2–3 mm long. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

$2n = 14$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Western Asia. Palestine, Israel & Jordan.

Aegilops sharonensis Eig. *Notizbl. Bot. Gart. Berlin*, 10: 489 (1928).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Israel. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Hab. Palastina: Beer-Jakob (an der Haifa-Kantara-Bahn), Tel-Aviv und Umgebung, Schechunath Borohov (coll. Eig); Herzlia, Arsuf....

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 209 as var. *sharonensis*).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Sharon, Palestine.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual. Culms 40–100 cm long. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades flat or involute, 10–20 cm long, 4–5 mm wide.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, linear, bilateral, 7–13 cm long, bearing 7–15 fertile spikelets on each. Rhachis fragile at the nodes. Spikelet packing broadside to rhachis. Rhachis internodes oblong, falling with spikelet above. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets rudimentary, 1–2 in number.

Fertile Spikelets. Spikelets comprising 3–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 8–13 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume oblong, 6–7 mm long, 1 length of upper glume, coriaceous, without keels, 6–7 -veined. Lower glume lateral veins thickened, ribbed, parallel at apex. Lower glume surface scabrous. Lower glume apex dentate, 2 -fid. Upper glume oblong, 6–7 mm long, 0.75

length of adjacent fertile lemma, coriaceous, without keels, 6–7 -veined. Upper glume lateral veins thickened, ribbed, parallel at apex. Upper glume surface scabrous. Upper glume apex dentate, 2 -fid.

Florets. Fertile lemma elliptic, 8–11 mm long, coriaceous, keeled, keeled above, 5 -veined, more than 3-veined. Lemma apex dentate, 2 -fid, awned or awned only on distal spikelets, 1 -awned. Principal lemma awn from a sinus, 30–80 mm long overall. Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

$n = 7$ (1 ref TROPICOS). $2n = 12$ (1 ref TROPICOS), or 14 (2 refs TROPICOS).

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Western Asia. Palestine, Israel & Jordan.

Aegilops speltoides Tausch. *Flora* 9: 109 (1837).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Turkey. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Turkey, Yoggat to Corum: Bornmuller 1753 (B neo, BM, FI, G, K, L, LD, NY, P, W, Z)).

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 212 as var. *speltoides* & var. *ligustica*), N.L.Bor, *Gramineae* in *Flora of Iraq* (1968) (189, Pl. 63).

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Similar to *Spelta*.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, 20–70 cm long. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 5–15 cm long, 2–3 mm wide, glaucous. Leaf-blade surface scabrous, rough on both sides, pilose, sparsely hairy.

Inflorescence. Inflorescence composed of racemes, deciduous as a whole. Racemes 1, single, linear, straight or arcuate, bilateral, 8–11 cm long, bearing 6–13 fertile spikelets on each. Rhachis tough, semiterete. Spikelet packing broadside to rhachis. Rhachis internodes linear, 1 length of fertile spikelet. Spikelets appressed, solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets absent or rudimentary, 0–1 in number.

Fertile Spikelets. Spikelets comprising 4–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 8–14 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume oblong, asymmetrical, 5–9 mm long, 1 length of upper glume, coriaceous, without keels, 7–9 -veined. Lower glume lateral veins unequally thickened, ribbed. Lower glume apex with a unilateral tooth. Upper glume oblong, asymmetrical, 5–9 mm long, 0.9 length of adjacent fertile lemma, coriaceous, without keels, 7–9 -veined. Upper glume lateral veins unequally thickened, ribbed, parallel at apex. Upper glume apex with a unilateral tooth, truncate.

Florets. Fertile lemma oblong, 8–11 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, awned only on distal spikelets, 1 -awned. Principal lemma awn 20–120 mm long overall. Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, ciliate. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

Derivation (Clifford & Bostock 2007): in honor of Jgnaz Friedrich Tausch (1793–1848) Bohemian botanist.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculate ascending, 25–30 cm long. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 8–17 cm long, 3–5 mm wide. Leaf-blade surface scaberulous, glabrous or pilose.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, linear, smoothly terete, bilateral, 5–10 cm long, 5–8 mm wide, bearing 9–11 fertile spikelets on each. Rhachis fragile at the nodes. Spikelet packing broadside to rhachis. Rhachis internodes oblong, falling with spikelet above. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets absent or rudimentary, 0–2 in number.

Fertile Spikelets. Spikelets comprising 3–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 6–8 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume oblong, 5–6 mm long, 1 length of upper glume, coriaceous, without keels, 7–9 -veined. Lower glume lateral veins unequally thickened, ribbed. Lower glume apex with a unilateral tooth, truncate. Upper glume oblong, 5–6 mm long, 0.8–0.9 length of adjacent fertile lemma, coriaceous, without keels, 7–9 -veined. Upper glume lateral veins unequally thickened, ribbed, parallel at apex. Upper glume apex with a unilateral tooth, truncate.

Florets. Fertile lemma oblong or ovate, 6–7 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma apex entire, truncate, awned or awned only on distal spikelets, 1 -awned. Principal lemma awn subterete below, 30–40 mm long overall (lower spikelets 0–18). Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

Derivation (Clifford & Bostock 2007): *L. umbella*, parasol; *-ula*, diminutive; *-atum*, possession.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or decumbent, 10–30 cm long. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 3–10 cm long, 1–2 mm wide. Leaf-blade surface glabrous or pilose.

Inflorescence. Inflorescence composed of racemes, deciduous as a whole. Racemes 1, single, lanceolate or ovate, bilateral, 2.5–4 cm long, bearing few fertile spikelets, bearing 2 fertile spikelets on each. Rhachis flattened, terminating in a sterile spikelet. Spikelet packing broadside to rhachis. Rhachis

internodes cuneate, 2 mm long, 0.25 length of fertile spikelet. Spikelets ascending, solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets rudimentary, (2–)3 in number.

Apical sterile spikelets barren, 1–3 in number (many-awned).

Fertile Spikelets. Spikelets comprising 2 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets obovate, laterally compressed, 7–11 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume obovate, 5–8 mm long, 1 length of upper glume, coriaceous, without keels, 7–9 -veined. Lower glume lateral veins unequally thickened. Lower glume surface scabrous. Lower glume apex truncate, awned, 3–5 -awned, awn 20–35 mm long. Upper glume obovate, 5–8 mm long, 0.9 length of adjacent fertile lemma, coriaceous, without keels, 7–9 -veined. Upper glume lateral veins parallel at apex. Upper glume surface scabrous, rough on veins. Upper glume apex truncate, awned, 3–5 -awned, awn 20–35 mm long.

Florets. Fertile lemma elliptic, 6–9 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma margins ciliolate. Lemma apex awned, 1–3 -awned. Principal lemma awn spreading, 15–35 mm long overall, limb scabrous. Lateral lemma awns absent or present, shorter than principal. Palea 2 -veined. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, ciliate. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, ellipsoid, hairy at apex.

Aegilops vavilovii (Zhuk.) Chennav. *Acta Hort. Gotoburg.* 23: 167 (1960).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Syria. **Basionym or Replaced Name:** *Aegilops crassa* subsp. *vavilovi* Zhuk., *Bull. Appl. Bot. Gen. Pl. Breed.* 13:554 (1928). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Syria, Salame: Vavilov 29028 (WIR lecto).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Nikolai Ivanovich Vavilov (1887–1942) Russian plant geneticist.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, robust, 30–75 cm long. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 10–20 cm long, 4–10 mm wide.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, moniliform, smoothly terete, bilateral, 10–15 cm long, bearing 7–10 fertile spikelets on each. Rhachis fragile at the nodes, semiterete. Spikelet packing broadside to rhachis. Rhachis internodes oblong, falling with spikelet alongside. Spikelets appressed, solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets absent or rudimentary, 0–2 in number.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 8–15 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume ovate, asymmetrical, 7–10 mm long, 1 length of upper glume, coriaceous, without keels, 7–10 -veined. Lower glume lateral veins unequally thickened, ribbed, parallel at apex. Lower glume surface pubescent. Lower glume apex dentate, 2–3 -fid, truncate, awned or awned only on distal spikelets, 1 -awned, awn terminal (on adaxial lobe), awn 10–25 mm long. Upper glume ovate, asymmetrical, 7–10 mm long, 0.9 length of adjacent fertile lemma, coriaceous, without keels, 7–10 -veined. Upper glume lateral veins unequally thickened, ribbed. Upper glume surface pubescent. Upper glume apex dentate, 2–3 -fid, truncate, awned or awned only on distal spikelets, 1 -awned, awn terminal (on adaxial lobe), awn 10–25 mm long.

Florets. Fertile lemma ovate, 8–11 mm long, coriaceous, keeled, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex dentate, 3 -fid, with outer lobes shorter, truncate, awned, 1 -awned or 2 -awned. Principal lemma awn flat below, 50–80 mm long overall. Lateral lemma awns absent or present, arising on apex of lobes. Palea 2 -veined. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, hairy at apex.

Derivation (Clifford & Bostock 2007): *L. venter*, belly; *-osa*, abundance. Spikelets inflated.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, 30–65 cm long. Leaf-sheaths pilose. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 8–17 cm long, 1.5–4.5 mm wide. Leaf-blade surface pilose.

Inflorescence. Inflorescence composed of racemes, not deciduous as a whole or deciduous as a whole. Racemes 1, single, linear or moniliform, bilateral, 5 cm long, bearing few fertile spikelets, bearing 4–6 fertile spikelets on each. Rhachis tough or fragile at the nodes. Spikelet packing broadside to rhachis. Rhachis internodes oblong, when fragile falling with spikelet alongside. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets rudimentary, 1–2 in number.

Fertile Spikelets. Spikelets comprising 4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 5–14 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume ovate, gibbous, 4.2–11 mm long, 1 length of upper glume, coriaceous, without keels, 7–9 -veined. Lower glume lateral veins thickened, ribbed. Lower glume surface smooth or asperulous, rough on veins. Lower glume apex dentate, 3 -fid, mucronate, 3 -awned, awn 17–95 mm long. Upper glume ovate, gibbous, 4.2–11 mm long, 1 length of adjacent fertile lemma, coriaceous, without keels, 7–9 -veined. Upper glume lateral veins thickened, ribbed, parallel at apex. Upper glume surface smooth or asperulous, rough on veins. Upper glume apex dentate, 3 -fid, awned, 3 -awned, awn 17–95 mm long.

Florets. Fertile lemma oblong, 4–11.3 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma margins ciliolate. Lemma apex dentate, 3 -fid, awned, (2–)3 -awned. Principal lemma awn 50–95 mm long overall. Palea 6–11.5 mm long, 2 -veined. Palea keels scaberulous, ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Anthers 3, 3.2–4.7 mm long. Ovary pubescent on apex. Caryopsis with adherent pericarp, ovoid, 4.5–8 mm long, hairy at apex.

$n = 14$ (2 refs TROPICOS). $2n = 28$ (4 refs TROPICOS).

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia.

Region. Northern Europe (*), Southwestern Europe, Southeastern Europe.

Country /Province /State. : GB Aliens (Ryves et al). : Balears, Corsica, France, Spain. : Italy, Sicily, Yugoslavia. **Northern Africa.** Algeria, Egypt, Libya, Morocco, Tunisia. **Western Asia, China.** China North-Central, Qinghai.

Hebei, Shaanxi.

Aeluropus badghyzi Tselev. *Novosti Sist. Vyssh. Rast.*, 16: 6 (1979).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Russia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Turcomania, Lake Erojlanduz: Makeda (LE holotype).

Illustrations: None found.

Classification. Subfamily Chloridoideae. Tribe: Cynodonteae.

Habit, Vegetative Morphology. Annual, culms solitary. Culms erect or geniculately ascending, 3–12 cm long. Culm-nodes pubescent. Leaves distichous. Leaf-sheaths pilose, outer margin hairy. Ligule a ciliolate membrane, 0.1–0.2 mm long. Leaf-blades 2–3 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, oblong, multilateral, 0.5–1.6 cm long, 0.4–1 mm wide. Spikelet packing broadside to rhachis, crowded. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 5–12 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 4–7 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume elliptic, 2–2.6 mm long, chartaceous, 1-keeled, 5–7 -veined. Lower glume surface pilose. Lower glume apex acute. Upper glume elliptic, 2–2.6 mm long, 0.7–0.8 length of adjacent fertile lemma, chartaceous, 1-keeled, 5–7 -veined. Upper glume surface pilose. Upper glume apex acute.

Florets. Fertile lemma lanceolate or ovate, 2.6–3.2 mm long, chartaceous, keeled, 9–11 -veined, more than 3-veined. Lemma surface pilose, hairy below. Lemma margins ciliate. Lemma apex acute, mucronate. Palea 1 length of lemma, hyaline, 2 -veined. Palea keels ciliate, adorned below, with 0.33 of their length adorned. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, fleshy. Anthers 3, 1.2–1.6 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Middle Asia. Tadjhikistan.

***Aeluropus laciniatus* Khodash. *Iran. J. Bot.* 18(1): 64 (2012).**

TYPE from Iran. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: N of Khorasan, Kashmar, Kuh Sorkh, road of Rivash to Ataieh, 1550 m., *Ayatollahi & Zangui 14623* (HT: FUMH; IT: TARI).

Illustrations: None found.

Classification. Subfamily Chloridoideae. Tribe: Cynodonteae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Stolons present. Culms erect, 5–30 cm long. Culm-internodes distally pubescent. Leaves distichous. Leaf-sheaths glabrous on surface or pubescent, outer margin hairy. Ligule a ciliate membrane, 0.5 mm long. Leaf-blades curved, linear or lanceolate, 0.1–4.5 cm long, 1–2 mm wide, indurate, stiff. Leaf-blade surface ribbed, scabrous, rough abaxially. Leaf-blade margins scabrous. Leaf-blade apex acuminate, pungent.

Inflorescence. Inflorescence composed of racemes. Racemes 2–12, borne along a central axis, in a bilateral false spike, appressed, unilateral, 0.5–1.5 cm long. Central inflorescence axis 1–2 cm long. Spikelet packing broadside to rhachis, crowded, regular, 2 -rowed. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 4–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–4 mm long, 2–2.5 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 2–2.2 mm long, 0.9 length of upper glume, chartaceous, much thinner on margins, 1-keeled, 2–3 -veined. Lower glume primary vein scabrous. Lower glume surface pubescent, hairy at base. Lower glume apex acute, mucronate. Upper glume ovate, 2.2–2.5 mm long, 1 length of adjacent fertile lemma, chartaceous, with membranous margins, 1-keeled, 3–5 -veined. Upper glume primary vein scabrous. Upper glume surface pubescent, hairy at base. Upper glume apex acute, mucronate.

Florets. Fertile lemma ovate, 2.25–2.5 mm long, chartaceous, keeled, 9–11 -veined, more than 3-veined. Lemma surface pilose (sparsely), hairy at base. Lemma margins ciliate. Lemma apex apiculate. Palea 1.8–2 mm long, 2 -veined. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, cuneate, fleshy, truncate. Anthers 3, 1.2–1.5 mm long.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Western Asia. Iran.

Illustrations (Books): H.Jacques-Felix, *Les Graminees d'Afrique tropicale* (1962) (196, Fig. 117), N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 368), S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (94, Fig. 38), L.Boulos, *Flora of Egypt* 4 (2005) (246, Pl. 72), T.A.Cope, in M.Thulin, *Poaceae* (Gramineae). *Flora of Somalia* (1995) (170, Fig. 84), N.L.Bor, *Gramineae in Flora of Iraq* (1968) (425, Pl. 160), K.M.Mathew, *Illustrations on the Flora of Tamilnadu Carnatic* (1982) (Pl. 800), G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Fig. 194).

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Pl. 11).

Derivation (Clifford & Bostock 2007): Gk. *lagos*, hare; *pous*, foot; *-oides*, resembling.

Classification. Subfamily Chloridoideae. Tribe: Cynodonteae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated, scaly, hairy. Stolons absent or present. Butt sheaths villous. Culms geniculately ascending or prostrate, 5–30 cm long. Leaves cauline, distichous. Leaf-sheaths loose, open for most of their length, 0.4–1 cm long, longer than adjacent culm internode, without keel, indistinctly veined, glabrous on surface or pilose, outer margin glabrous (hyaline). Ligule a ciliolate membrane. Leaf-blade base broadly rounded, symmetrical. Leaf-blades lanceolate, 0.5–4 cm long, 2–3 mm wide, coriaceous, stiff, glaucous. Leaf-blade midrib indistinct. Leaf-blade surface ribbed, scabrous, rough on both sides, glabrous or pilose. Leaf-blade margins entire, scaberulous. Leaf-blade apex acuminate, pungent.

Inflorescence. Inflorescence composed of racemes. Peduncle 0.5–3 cm long, pubescent above. Racemes 1, single, oblong or globose, unilateral or multilateral, 0.5–1 cm long. Spikelet packing broadside to rachis, crowded, regular, 2-rowed. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 0–1 basal sterile florets, 4–18 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3–6 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume elliptic, 1.5 mm long, 0.7–0.8 length of upper glume, chartaceous, 1-keeled, 1–3 -veined. Lower glume surface villous. Lower glume apex acute. Upper glume elliptic, 2 mm long, 0.7–0.8 length of adjacent fertile lemma, chartaceous, 1-keeled, 3–5 -veined. Upper glume surface villous. Upper glume apex erose, obtuse.

Florets. Basal sterile florets absent or 1, barren, without significant palea. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma elliptic, 2–3 mm long, chartaceous, keeled, 9–11 -veined, more than 3-veined. Lemma lateral veins prominent. Lemma surface villous. Lemma apex apiculate. Palea 1 length of lemma, hyaline, 2 -veined. Palea surface pilose, hairy on back or on flanks. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, cuneate, fleshy, ciliate, truncate. Anthers 3, 1–1.5 mm long. Caryopsis with adherent pericarp, oblong, dorsally compressed. Embryo 0.6 length of caryopsis. Hilum punctiform.

n = 20 (2 refs TROPICOS).

Distribution (TDWG). **Continent.** Europe, Africa, Temperate Asia, Tropical Asia.

Derivation (Clifford & Bostock 2007): Gk. *hyalos*, glass; *pteron*, wing. Lemma has two large hyaline wings.

Classification. Subfamily Chloridoideae. Tribe: Chloridoideae incertae sedis.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–60 cm long, 4–6 -noded. Ligule a ciliolate membrane, 0.3 mm long. Leaf-blades convolute, 15–25 cm long, 1–1.5 mm wide, glaucous. Leaf-blade surface pubescent, sparsely hairy, hairy adaxially. Leaf-blade margins spinulose.

Inflorescence. Inflorescence composed of racemes, subtended by an inflated leaf-sheath, embraced at base by subtending leaf. Racemes 1, single, flexuous, unilateral, 14–22 cm long. Rhachis angular, 0.7 mm wide, glabrous on surface, glabrous on margins. Spikelet packing broadside to rhachis, crowded. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 15 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma, gaping. Lower glume lanceolate, 7 mm long, 0.9–1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 7 mm long, 0.6 length of adjacent fertile lemma, membranous, without keels, 3–5 -veined. Upper glume lateral veins ribbed. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, 12–13 mm long, chartaceous, much thinner above, pallid, keeled, 3 -veined, 0–3 -veined. Lemma surface pubescent. Lemma margins ciliate. Lemma hairs white, 1 mm long. Lemma apex lobed, 2 -fid, with lanceolate lobes, incised 0.66 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, curved, 20 mm long overall. Palea ovate, 0.3 length of lemma, 2 -veined. Palea keels ciliolate. Palea surface pubescent. Palea apex acuminate. Apical sterile florets 5–7 in number, barren, separate, elliptic (resembling fertile). Apical sterile lemmas pubescent, awned, 1 -awned.

Flower and Fruit. Lodicules 2, oblong, 0.5 mm long, fleshy. Anthers 3, 0.7 mm long. Caryopsis with free soft pericarp, ellipsoid, dorsally compressed, biconvex, 2 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Ethiopia (inc. Eritrea), Somalia.

Afrotrichloris martinii Chiov. *Ann. Bot., Roma*, 13: 372 (1914).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Somalia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Benadir: Boscaglia di Mogadiscio lungo la strada di Afgoi fra il 4–5 km, 26 May 1913, *Paoli 89*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Claude Martin (1731–1800) French-born British soldier who collected in India.

Classification. Subfamily Chloridoideae. Tribe: Chloridoideae incertae sedis.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 15–70 cm long. Leaf-sheath oral hairs bearded. Ligule a ciliolate membrane. Leaf-blades filiform, convolute, 5–15 cm long, 0.5–1.5 mm wide.

Inflorescence. Inflorescence composed of racemes, subtended by an inflated leaf-sheath, embraced at base by subtending leaf. Racemes 1, single, unilateral, 3–15 cm long. Rhachis angular. Spikelet packing broadside to rhachis, crowded. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 16–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma, gaping. Lower glume lanceolate, 10–20 mm long, 0.6–1 length of upper glume, membranous, without keels, 1–3 -veined. Lower glume apex acuminate or setaceously acuminate. Upper glume elliptic, 16–20 mm long, 1 length of adjacent fertile lemma, membranous, without keels, 3–5 -veined. Upper glume lateral veins ribbed. Upper glume apex acuminate or setaceously acuminate.

Florets. Fertile lemma elliptic, 16–20 mm long, coriaceous, much thinner above, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins augmented by subsidiaries in lobes. Lemma surface pubescent, hairy on back or on veins. Lemma margins eciliate. Lemma apex lobed, 2 -fid, with linear lobes, incised 0.66–0.75 of lemma length, attenuate, awned, 3 -awned. Principal lemma awn from a sinus, curved, 25–45 mm long overall. Lateral lemma awns present, arising on apex of lobes, 1–16 mm long, shorter than principal. Palea ovate, 0.3 length of lemma, 2 -veined. Palea keels winged, narrowly winged, ciliolate. Apical sterile florets 4 in number, barren, in a clump, elliptic, 20 mm long. Apical sterile lemmas lobed, 2 -fid, awned, 3 -awned.

Flower and Fruit. Lodicules 2, fleshy. Anthers 3. Caryopsis with free soft pericarp.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Somalia.

Aggenium goyazense (Hack.) Clayton. *Kew Bull.* 27 (3): 447 (1972).

TYPE from Brazil. **Basionym or Replaced Name:** *Andropogon goyazensis* Hack., *Flora*, 48 : 122. (1885). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *A.F.M. Glaziou* 22571, no date, Brazil: Goiás (K; IST: US-76469 (fragm. ex K)). Awns from first specimen cited no. 22438, also cited no. 22572. ST: *Glaziou* 22438, Brazil: Goiás (K). ST: *Glaziou* 22438a, Brazil: Goiás (K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Goyaz Province, Brazil.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths villous. Culms 60–100 cm long, 6–10 -noded. Ligule an eciliate membrane. Leaf-blades 10–25 cm long, 3–5 mm wide. Leaf-blade surface glabrous or hirsute. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, erect, 5–6 cm long, bearing 5–6 fertile spikelets on each. Rhachis fragile at the nodes, flattened, ciliate on margins. Rhachis internodes linear. Rhachis internode tip oblique, flat. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, flattened, ciliate.

Sterile Spikelets. Basal sterile spikelets well-developed, 10–12 in number, male, lanceolate or oblong, 10–15 mm long, larger than fertile. Basal sterile spikelet glumes herbaceous, glabrous.

Companion sterile spikelets well-developed, male, lanceolate, 10–12 mm long, longer than fertile, separately deciduous. Companion sterile spikelet callus square or oblong, 0.5 mm long, obtuse. Companion sterile spikelet glumes chartaceous, glabrous, acute. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, subterete, 8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus cuneate, 2 mm long, pubescent, base pungent, attached obliquely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear or oblong, 1 length of spikelet, coriaceous, without keels, 7 -veined. Lower glume surface with a

longitudinal median groove, pilose. Lower glume apex obtuse. Upper glume oblong, coriaceous, without keels. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret ovate, hyaline, ciliate on margins. Fertile lemma linear, cartilaginous, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex entire, acute, awned, 1 -awned. Principal lemma awn geniculate, 50–65 mm long overall, with twisted column. Column of lemma awn pubescent. Palea absent or minute.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central, Brazil South. Mato Grosso, Goias. Distrito Federal, Mato Grosso, Goiás. Paraná.

Agenium leptocladum (Hack.) Clayton. *Kew Bull.*, 27 (3): 447 (1972).

Derivation (Clifford & Bostock 2007): Gk. *leptos*, narrow; *klados*, branch. Culms slender.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Basal innovations extravaginal. Culms erect, slender, 50–60 cm long. Ligule a ciliolate membrane, 1.5 mm long. Leaf-blades 6–10 cm long, 2–3 mm wide. Leaf-blade surface glabrous or pilose. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes. Peduncle scaberulous above. Racemes 1, single, erect, 3.5–4.5 cm long. Rhachis fragile at the nodes, flattened, ciliate on margins. Rhachis internodes linear, 3 mm long. Rhachis internode tip oblique, flat. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, flattened, 3 mm long, ciliate.

Sterile Spikelets. Basal sterile spikelets well-developed, 8–12 in number, male, lanceolate, 7–9 mm long, equalling fertile. Basal sterile spikelet glumes herbaceous.

Companion sterile spikelets well-developed, male, lanceolate, 7–10 mm long, as long as fertile, separately deciduous. Companion sterile spikelet callus square, 0.5 mm long, obtuse. Companion sterile spikelet glumes herbaceous, acute. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, subterete, 7–8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus cuneate, 1–2 mm long, pilose, base pungent, attached obliquely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic, 1 length of spikelet, coriaceous, without keels, 8 -veined. Lower glume surface with a longitudinal median groove, pubescent. Lower glume apex obtuse. Upper glume lanceolate, coriaceous, without keels. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret 3 mm long, hyaline. Fertile lemma linear, 4 mm long, cartilaginous, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex entire, acute, awned, 1 -awned. Principal lemma awn geniculate, 20–50 mm long overall, with twisted column. Column of lemma awn pubescent. Palea absent or minute.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil West Central, Brazil Southeast, Brazil South. Paraguay.

Mato Grosso, Goias, Sao Paulo Parana, Catarina, Rio Grande do Sul. Distrito Federal, Mato Grosso, Goiás. Sao Paulo. Paraná, Santa Catarina. Corrientes, Misiones.

Agenium majus Pilger. Fedde, *Repert.* 43: 82 (1938).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Paraguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *K. Fiebrig 6418*, 1909–1910, Paraguay: in regione fluminis Alto Parana (SI).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. great. Culms tall.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Basal innovations intravaginal. Culms 100–120 cm long. Culm-nodes bearded. Ligule an eciliate membrane, 3 mm long. Leaf-blades convolute, 15–30 cm long, 3–6 mm wide, stiff. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 3–6, digitate, drooping, 5 cm long. Central inflorescence axis 1–2 cm long. Rhachis fragile at the nodes, flattened, ciliate on margins. Rhachis internodes linear, 4 mm long. Rhachis internode tip oblique, flat. Raceme-bases linear, 5–10 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, flattened, 4–5 mm long, ciliate.

Sterile Spikelets. Basal sterile spikelets well-developed, 18 in number, male, lanceolate, 12 mm long, larger than fertile. Basal sterile spikelet glumes chartaceous.

Companion sterile spikelets well-developed, male, lanceolate, laterally compressed, 12 mm long, longer than fertile, separately deciduous. Companion sterile spikelet callus square, 0.5 mm long, obtuse. Companion sterile spikelet glumes chartaceous, distinctly veined, 18 -veined, acute. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, subterete, 6.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus linear, 1–1.5 mm long, bearded, base pungent, attached obliquely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, without keels, 8 -veined. Lower glume surface with a longitudinal median groove, pubescent, hairy above. Lower glume apex obtuse. Upper glume lanceolate, coriaceous, without keels. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret elliptic, hyaline, truncate. Fertile lemma linear, cartilaginous, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex entire, acute, awned, 1 -awned. Principal lemma awn geniculate, 60 mm long overall, with twisted column. Column of lemma awn pubescent. Palea absent or minute.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil West Central. Paraguay. Mato Grosso. Mato Grosso do Sul.

Agenium villosum (Nees) Pilger. Fedde, *Repert.* 43: 82 (1938).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Heteropogon villosus* Nees, *Agrost. Bras.* 362 (1829). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *F. Sellow s.n.*, s.d., Brasilia aequinoctialis (B; IT: LE-TRIN-0345.02, US-925206 (ex Manila ex B)). US-925206 was annotated as *Heteropogon villosus* var. *genuinus* Hack., and has Reliquiae d. Sello Gram. no. 1276 2 ___ 160x.

Recent Synonyms: *Agenium nutans* Nees, *Lindl. Introd. Nat. Syst.* ed. 2: 447 (1836).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (1196, Fig. 234 & 1207, Fig. 237), A.Burkat, *Flora Illustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (506, Fig. 213), B.Rosengurt,

Gramineas Uruguayas I (1970) (158, Fig. 61), R. Pilger, *Die Natürlichen Pflanzenfamilien* 14e (1940) (183, Fig. 98).

Derivation (Clifford & Bostock 2007): *L. villi*, long weak hairs; *-osa*, abundance. The plant in whole or in part covered with long hairs.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistirinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 15–50 cm long. Ligule an eciliate membrane. Leaf-blades 10–25 cm long, 2–4 mm wide.

Inflorescence. Inflorescence composed of racemes. Racemes 2–7, paired or digitate, drooping, 3–4 cm long. Rhachis fragile at the nodes, flattened, ciliate on margins. Rhachis internodes linear. Rhachis internode tip oblique, flat. Raceme-bases filiform, 2–10 mm long, glabrous. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, flattened, villous.

Sterile Spikelets. Basal sterile spikelets well-developed, 4–9 in number, male, 5–6 mm long, equalling fertile. Basal sterile spikelet glumes herbaceous, villous.

Companion sterile spikelets well-developed, male, elliptic, 5–6 mm long, as long as fertile, separately deciduous. Companion sterile spikelet callus cuneate, 0.5 mm long, obtuse. Companion sterile spikelet glumes herbaceous, tuberculate, villous, acute. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, subterete, 5–7.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus linear, 1 mm long, bearded, base pungent, attached obliquely. Spikelet callus hairs red.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, without keels, 8 -veined. Lower glume surface with a longitudinal median groove, pilose. Lower glume apex obtuse. Upper glume lanceolate, coriaceous, without keels. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3–4 mm long, hyaline, 2 -veined, truncate. Fertile lemma linear, cartilaginous, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex entire, acute, awned, 1 -awned. Principal lemma awn geniculate, 30–40 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

TYPE from Brazil. **Basionym or Replaced Name:** *Olyra lancifolia* Mez, *Notizbl. Bot. Gart. Berlin*, 7: 45 (1917). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E.H.G. Ule 5951*, Oct 1901, Brazil: Amazonas: ad flumen Jurua prope Fortaleza [confluence of Rio Jurua and Rio Solimoes, ca. 02.35S 65.40W (B(photo, fragm. of leaf, US-3168812); IT: HBG).

Illustrations (Books): E.J. Judziewicz et al, *American Bamboos* (1999) (263, Fig. 161).

Illustrations (Journals): *Novon* (3:308, Fig. 1 (1993)).

Derivation (Clifford & Bostock 2007): *L. lanceus*, lance; *folium*, leaf. Leaf-blade lanceolate.

Classification. Subfamily Bambusoideae. Tribe: Olyreae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms geniculately ascending, 15–50 cm long, swollen at the base. Culm-internodes distally pubescent (in lines). Culm-nodes glabrous. Lateral branches lacking. Leaves cauline, 3–15 per branch. Leaf-sheaths 2–3 cm long, keeled, glabrous on surface, outer margin hairy. Leaf-sheath oral hairs lacking or ciliate. Leaf-sheath auricles erect,

0.5 mm long. Ligule a ciliolate membrane, 0.3–0.6 mm long. Leaf-blade base cuneate, asymmetrical, with a brief petiole-like connection to sheath, petiole 0.1–0.2 cm long, petiole pubescent. Leaf-blades lanceolate, 6–16 cm long, 3–30 mm wide, mid-green or mid-green and purple, discolorous with last colour beneath. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate. Monoecious, with male and female spikelets in the same inflorescence.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, subtended by an unspecialized leaf-sheath or bracts (1 bract when a short basal branch present), embraced at base by subtending leaf, with 1–4 peduncles per sheath. Axillary inflorescences similar to terminal. Peduncle 4–8 cm long, pubescent above. Racemes 1, single, 2–4 cm long, bearing few fertile spikelets, bearing 1(–4) fertile spikelets on each. Sexes segregated, on bisexual branches, with male below, with 4–12 male spikelets per branch. Spikelets solitary. Fertile spikelets pedicelled. Male spikelets pedicelled. Pedicels present, 0.5–3 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, dorsally compressed, 11–15 mm long, falling entire or breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes deciduous, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–10 mm long, 1 length of upper glume, chartaceous, without keels, 5(–8) -veined. Lower glume lateral veins convergent at apex. Lower glume surface glabrous or puberulous, inner surface scabrous (above). Lower glume apex acuminate, awned, 1 -awned, awn 4.5–8 mm long. Upper glume lanceolate, 7–10 mm long, chartaceous, without keels, 3 -veined. Upper glume surface glabrous or puberulous. Upper glume apex acute, awned, 1 -awned, awn 2.5–5 mm long.

Florets. Fertile florets female. Fertile lemma elliptic, 7–8 mm long, 1.7–2 mm wide, indurate, pallid and purple, mottled with last colour, shiny, without keel. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma hairs 1 mm long. Lemma apex acute, awned, 1 -awned. Principal lemma awn 1–1.5 mm long overall. Palea indurate.

Flower and Fruit. Male spikelets distinct from female, 1 flowered, separately deciduous, linear, 7–8 mm long, hairy. Male spikelet glumes absent. Male spikelet lemma 7–8 mm long, 3 -veined, awned, with 1–2 mm long awn.

Distribution (TDWG). **Continent.** South America.

Country /Province /State. **Western South America** and **Brazil.** Colombia, Peru. Brazil North. Amazonas, Pará.

Agropyron badamense Drobov. *Fedde, Repert.* 21: 44 (1925).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Dorofeevka: Abolin & Popov 8132 (TAK lecto).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Badan Khrebet a mountain range in Siberia.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms 20–40 cm long. Lateral branches lacking. Leaf-sheath oral hairs lacking. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades flat or involute, 10–20 cm long, 2–3 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, linear, bilateral, 1.5–3 cm long, 6–9 mm wide. Spikelet packing broadside to rhachis. Rhachis internodes oblong, 3–4 mm long. Spikelets ascending, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 3–4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, compressed strongly, 9–12 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, firmer than fertile lemma. Lower glume lanceolate, 5 mm long, 0.8 length of upper glume, coriaceous, 1-keeled, keeled all along, 1 -veined. Lower glume apex attenuate, awned, 1 -awned, awn 1–2 mm long. Upper glume lanceolate, 6 mm long, 0.8 length of adjacent fertile lemma, coriaceous, 1-keeled, keeled all along, 3 -veined. Upper glume lateral veins convergent at apex. Upper glume apex attenuate, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma elliptic, 7 mm long, chartaceous, shiny, keeled, 5 -veined, more than 3-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn 0.5–1.5 mm long overall. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Anthers 3 mm long. Ovary pubescent on apex. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Middle Asia. Turkmenistan.

Agropyron bulbosum Boiss. *Diagn. Pl. Orient., ser. 1*, 5: 75. (1844).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Iran. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Hab. in Persia, *Aucher.* 3065.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. bulbosus*, onion; *-osa*, abundance. Culm-bases swollen.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths thickened and forming a bulb. Culms erect or geniculately ascending, 10–20 cm long. Lateral branches lacking. Leaf-sheath oral hairs

lacking. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades 5–10 cm long, 1–3 mm wide. Leaf-blade surface puberulous, densely hairy, hairy adaxially. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, oblong, bilateral, 2–3 cm long, 12 mm wide. Rhachis scabrous on margins. Spikelet packing broadside to rhachis. Rhachis internodes oblong, 2 mm long. Spikelets pectinate, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, compressed strongly, 8–9 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, firmer than fertile lemma. Lower glume lanceolate, 5–6 mm long, 1 length of upper glume, coriaceous, much thinner on margins, 1-keeled, keeled all along, 3 -veined. Lower glume primary vein scabrous. Lower glume apex acute, awned, 1 -awned, awn 8–10 mm long. Upper glume lanceolate, 5–6 mm long, 0.6–0.7 length of adjacent fertile lemma, coriaceous, with hyaline margins, 1-keeled, keeled all along, 5 -veined. Upper glume primary vein scabrous. Upper glume lateral veins convergent at apex. Upper glume apex acute, awned, 1 -awned, awn 8–10 mm long.

Florets. Fertile lemma elliptic, 8–9 mm long, chartaceous, keeled, 5 -veined, more than 3-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn 6–9.5 mm long overall. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2. Ovary pubescent on apex. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Western Asia. Iran.

Agropyron cimmericum Nevski. *Trudy Sredne-Aziatsk. Gosud. Univ., Ser. 8b, Bot.* 17. 56 (1934).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Ukraine. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: (LE).HT: *S.Dzevanovskij s.n.*, 1 Jun 1925, Ukraine: [Crimea]: Kerch Peninsula: between Chechene & Kazantip: sand coast and dunes (LE). Orig. label: "Kerchenskij p-ov, peschanyj bereg i dyuny mezhdru sel. Chechene i sel. Kazantip,...".

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-icum*, belonging to. From the region of the Cimmerii, who lived about the River Dnieper, former Soviet Union.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms 25–50 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1 mm long. Leaf-blades convolute, 15–30 cm long, 2–4 mm wide. Leaf-blade surface puberulous, hairy adaxially.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 6–11 cm long, 8–15 mm wide. Rhachis pubescent on surface. Spikelet packing broadside to rhachis, crowded. Rhachis internodes oblong, 2–5 mm long. Spikelets pectinate, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 4–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 7–9 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, firmer than fertile lemma. Lower glume lanceolate, 3.5–6 mm long, 1 length of upper glume, coriaceous, 1-keeled, keeled all along, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate, awned, 1 -awned, awn 1–2 mm long. Upper glume lanceolate, 3.5–6 mm long, 0.6–0.8 length of adjacent fertile lemma, coriaceous, 1-keeled, keeled all along, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma elliptic, 6–7 mm long, chartaceous, keeled, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex acute, mucicous or awned, 1 -awned. Principal lemma awn 0.5–2 mm long overall. Palea keels ciliate, with 1–10 enations per keel. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, oblong, sulcate on hilar side, hairy at apex, apex fleshy. Embryo 0.2 length of caryopsis. Hilum linear, 1 length of caryopsis.

Distribution (TDWG). Continent. Europe.

Region. Eastern Europe.

Country /Province /State. Krym, Northwest European Russia, Ukraine.

Agropyron cristatum (L.) J. Gaertn. *Nov. Comm. Petrop.* 14 : 540 (1770).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960) (as *A. pectiniforme*), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. **Basionym or Replaced Name:** *Bromus cristatus* L., *Sp. Pl.* 78 (1753). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Siberia: Coll?.

Recent Synonyms: *Agropyron pectiniforme* Roem. & Schult., nom superfl., *Syst.* 2: 758. (1817). *Agropyrum brandzae* Pantu & Solacolu, *Bull. Sect. Sc. Acad. Roumaine* 9. 28 (1924).

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (69, Fig 41 as *A. distichum*), L.Boulos, *Flora of Egypt* 4 (2005) (209, Pl. 60), N.L.Bor, *Gramineae* in *Flora of Iraq* (1968) (213, Pl. 70 & 219, Pl. 73 as *Agropyron pectiniforme*), K.F.Best, et al, *Prairie Grasses* (1971) (31), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (280), G.Hegi, *Flora von Mitteleuropa* 1 (1909) (as *Agropyrum cristatum*), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 616 as *Agropyron cristatum* var. *cristatum*), E.Hafliger & E.Schultz, *Grass Weeds*, CIBA-GEIGY (2:5(1980)).

Derivation (Clifford & Bostock 2007): L. crested. Inflorescence forming a crest;

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms decumbent, 20–70 cm long. Leaf-sheath oral hairs lacking. Leaf-sheath auricles falcate. Ligule an eciliate membrane. Leaf-blades involute, 6–12 cm long, 1.5–3 mm wide, stiff.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, oblong, bilateral, 1–5 cm long. Rhachis pilose on surface. Spikelet packing broadside to rhachis. Spikelets pectinate, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 3–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, compressed strongly, 8–15 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, firmer than fertile lemma. Lower glume ovate, 3–5 mm long, 1 length of upper glume, coriaceous, 1-keeled, keeled all along, 3 -veined. Lower glume surface glabrous or pilose. Lower glume apex acuminate, awned, 1 -awned, awn 1–2 mm long. Upper glume ovate, 3–5 mm long, 0.66 length of adjacent fertile lemma, coriaceous, 1-keeled, keeled all along, 3 -veined. Upper glume lateral veins convergent at apex. Upper glume surface glabrous or pilose. Upper glume apex acuminate, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma elliptic, 5–7 mm long, chartaceous, keeled, keeled above, 5 -veined, more than 3-veined. Lemma surface pilose. Lemma apex acuminate, awned, 1 -awned. Principal lemma awn 3–4 mm long overall, limb scabrous. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, oblong, sulcate on hilar side, hairy at apex, apex fleshy. Embryo 0.2 length of caryopsis. Hilum linear, 1 length of caryopsis.

Agropyron dasyanthum Ledeb. *Ind. Sem. Dorpat.* 3. (1820).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Oleschky: Coll? (LE holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *dasys*, hairy; *anthos*, flower. Glumes and lemmas densely hairy.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms 40–75 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1–1.5 mm long. Leaf-blades convolute, 10–20 cm long, 2–4 mm wide. Leaf-blade midrib conspicuous. Leaf-blade surface puberulous, hairy adaxially.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 6–15 cm long, 7–18 mm wide. Rhachis glabrous on surface or pubescent on surface. Spikelet packing broadside to rhachis, lax. Rhachis internodes oblong, 3–10 mm long. Spikelets spreading or pectinate, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 5–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 7–12 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, firmer than fertile lemma. Lower glume lanceolate, 5–8 mm long, 1 length of upper glume, coriaceous, 1-keeled, keeled all along, 1 -veined. Lower glume primary vein eciliate or ciliate. Lower glume lateral veins absent. Lower glume apex acuminate, mucronate. Upper glume lanceolate, 5–8 mm long, 0.75–1 length of adjacent fertile lemma, coriaceous, 1-keeled, keeled all along, 1 -veined. Upper glume primary vein eciliate or ciliate. Upper glume lateral veins absent. Upper glume apex acuminate, mucronate.

Florets. Fertile lemma elliptic, 7–8 mm long, chartaceous, keeled, 5 -veined, more than 3-veined. Lemma surface pilose. Lemma apex acute. Palea keels eciliate or ciliate, with 1–3 enations per keel. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 5 mm long. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, oblong, sulcate on hilar side, hairy at apex, apex fleshy. Embryo 0.2 length of caryopsis. Hilum linear, 1 length of caryopsis.

Distribution (TDWG). Continent. Europe.

Region. Eastern Europe.

Country /Province /State. Northwest European Russia, Ukraine.

Agropyron deweyi ? Löve. *Feddes Repert.* 95(7–8): 432 (1984).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Turkey. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Turkey, Van, cult. in Utah: *Harlan PI 173622* .

Illustrations: None found.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–75 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane. Leaf-blades involute, 10–25 cm long, 4–6 mm wide. Leaf-blade surface hirsute, sparsely hairy, hairy on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Peduncle hirsute above. Racemes 1, single, lanceolate or oblong, bilateral, 5–7 cm long, 15 mm wide. Rhachis pilose on surface. Spikelet packing broadside to rhachis. Spikelets pectinate, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 3–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 12–15 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, firmer than fertile lemma.

Florets. Fertile lemma lanceolate, 5–8 mm long, chartaceous, keeled, 5 -veined, more than 3-veined. Lemma surface glabrous. Lemma apex acuminate, awned, 1 -awned. Principal lemma awn 5–8 mm long overall, limb scabrous. Palea 5–7 mm long. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 3, 3–4 mm long, yellow.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Western Asia. Turkey.

Agropyron krylovianum Schischkin. *Animadvers. Syst. Herb. Univ. Tomsk.* No. 2, 2 (1928).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: West Siberia, Altai, valley of river Chuya (TK).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. in honor of Porfirij Nikitic Krylov (1850–1931) Russian botanist.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Rhizomes elongated. Culms 40–100 cm long. Culm-internodes distally glabrous. Leaf-sheaths pilose, with reflexed hairs. Ligule an eciliate membrane. Leaf-blades 10–20 cm long, 1.2–5 mm wide. Leaf-blade surface scaberulous, rough adaxially, glabrous.

Inflorescence. Inflorescence composed of racemes. Peduncle scaberulous above. Racemes 1, single, linear or oblong, bilateral, 8–12 cm long, 7–14 mm wide. Rhachis pubescent on surface. Spikelet packing broadside to rhachis, crowded. Rhachis internodes oblong. Spikelets ascending, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 5–9 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 8–15 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, firmer than fertile lemma. Lower glume lanceolate, 4–8 mm long, 1 length of upper glume, coriaceous, 1-keeled, keeled all along, 3–4 -veined. Lower glume primary vein ciliate. Lower glume apex acuminate. Upper glume lanceolate, 4–8 mm long, 0.75–1 length of adjacent fertile lemma, coriaceous, 1-keeled, keeled all along, 3–4 -veined. Upper glume primary vein ciliate. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 7–9 mm long, chartaceous, keeled, 5 -veined, more than 3-veined. Lemma surface glabrous or pubescent. Lemma apex acute, awned, 1 -awned. Principal lemma awn 0.5–1.5 mm long overall. Palea 1 length of lemma. Palea keels ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 3, 4 mm long. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, hairy at apex, apex fleshy. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Siberia, Middle Asia. Altay, Irkutsk, Krasnoyarsk. Kazakhstan.

Agropyron michnoi Roshev. *Izv. Glavn. Bot. Sada SSSR* 28: 384 (1929).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Transbaical, Peschanoe Lake: Mikhnov (LE lecto).

Recent Synonyms: *Agropyron nathaliae* Sipliv., *Novit. Syst. Pl. Vasc., Acad. Sci. URSS*, 1968, 13 (1968).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 616).

Derivation (Clifford & Bostock 2007): honor of P. Michno (fl. 1924) Russian botanist.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Rhizomes elongated. Culms 50–90 cm long. Culm-internodes smooth, distally glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane. Leaf-blades 10–20 cm long, 5 mm wide. Leaf-blade surface puberulous, hairy adaxially.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, oblong or ovate, bilateral, 2–8 cm long, 10–20 mm wide. Rhachis pubescent on surface. Spikelet packing broadside to rhachis, crowded. Rhachis internodes oblong. Spikelets pectinate, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 5–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 10–15 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, firmer than fertile lemma. Lower glume lanceolate, 4–6 mm long, 1 length of upper glume, coriaceous, much thinner on margins, 1-keeled, keeled all along. Lower glume primary vein eciliate or ciliate. Lower glume apex acuminate, awned, 1 -awned, awn 1 mm long. Upper glume lanceolate, 4–6 mm long, 0.75–1 length of adjacent fertile lemma, coriaceous, with scarious margins, 1-keeled, keeled all along. Upper glume primary vein eciliate or ciliate. Upper glume apex acuminate, awned, 1 -awned, awn 1 mm long.

Florets. Fertile lemma lanceolate, 6–8 mm long, chartaceous, glaucous, keeled, 5 -veined, more than 3-veined. Lemma surface pilose to villous. Lemma apex acute, awned, 1 -awned. Principal lemma awn 2 mm long overall. Palea 1 length of lemma. Palea keels ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 3, 5–5.5 mm long. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, hairy at apex, apex fleshy. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Siberia, **China, Mongolia, Russia.** Buryatiya, Chita, Irkutsk, Tuva. Inner Mongolia. Mongolia.

Agropyron mongolicum Keng. *Journ. Wash. Acad. Sc.* 28: 305. (1938).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from Mongolia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: collected on exposed sandy and rocky slope, Payin Obo, about 90 li northeast of Peiling Miao, Suiyuan Province, Aug. 9, 1935, *Y.L. Keng # 3400 (Roerich Exp. 748)*.

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 615 as *Agropyron mongolicum* var. *mongolicum* & as *Agropyron mongolicum* var. *villosum*).

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Mongolia.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Culms geniculately ascending, 20–50 cm long, 1–1.2 mm diam., 1–3 -noded, with 0.15–0.6 of their length below uppermost node. Leaf-sheaths tight, 3.5–8 cm long, mostly shorter than adjacent culm internode, glabrous on surface. Ligule a ciliolate membrane, 0.5 mm long, truncate. Leaf-blades straight or curved, involute, 2.5–8 cm long, 2–3 mm wide, stiff, glaucous. Leaf-blade surface puberulous, hairy adaxially.

Inflorescence. Inflorescence composed of racemes. Peduncle glabrous or pubescent above. Racemes 1, single, bilateral, 3.5–7 cm long, 5–7 mm wide. Rhachis with scattered hairs to puberulous on surface. Spikelet packing broadside to rhachis. Rhachis internodes linear, 2–5 mm long. Spikelets ascending, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 3–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic to oblong, laterally compressed, 8–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 1 mm long, pubescent.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 4–5 mm long, 0.8 length of upper glume, coriaceous, much thinner on margins, without keels, 3 -veined. Lower glume apex setaceously acuminate. Upper glume lanceolate, 5–6 mm long, 0.8–0.9 length of adjacent fertile lemma, coriaceous, with scarious margins, without keels, 3 -veined. Upper glume apex setaceously acuminate.

Florets. Fertile lemma lanceolate, 6–7 mm long, coriaceous, 5 -veined, more than 3-veined. Lemma surface glabrous or puberulous. Lemma apex acute, mucronate. Palea 1 length of lemma. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 3 mm long. Stigmas 2. Ovary pubescent on apex. Caryopsis with adherent pericarp, ellipsoid, 4 mm long.

Distribution (TDWG). **Continent.** Temperate Asia.

Country /Province /State. **China.** Inner Mongolia, China North-Central, Xinjiang. Gansu, Shaanxi, Shanxi.

Agropyron sinkiangense D.F. Cui. *Flora Xinjiangensis* 6: 602. 1996.

Accepted by: S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Xinjiang: Heshuo Xian, Haregti, in pascis frigidis altis mer. Tianshan, 2700 m, 18 Jul 1982, *sine coll.* 02–227 (HT: XJA-1AC).

Classification. Subfamily Pooideae. Tribe: Triticeae.

Distribution (TDWG). **Continent.** Temperate Asia.

Country /Province /State. **China.** Xinjiang.

Agropyron tanaiticum Nevski. *Acta Univ. As. Med. Ser. 8b Bot. Fasc.* 17, 56 (1934).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Oblivskaya: Gael (LE holo, K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -icum*, belonging to. From River Tanais, now Don, Russia.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms 30–80 cm long. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface or pubescent. Ligule an eciliate membrane, 3–5 mm long. Leaf-blades flat or convolute, 8–15 cm long, 2–5 mm wide. Leaf-blade surface puberulous, hairy adaxially.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 5–16 cm long, 5–7 mm wide. Rhachis glabrous on surface or pubescent on surface. Spikelet packing broadside to rhachis, lax. Rhachis internodes oblong. Spikelets ascending, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 3–4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 7–12 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, firmer than fertile lemma. Lower glume lanceolate, 3–7 mm long, 1 length of upper glume, coriaceous, 1-keeled, keeled all along, 1 -veined. Lower glume primary vein eciliate or ciliate. Lower glume lateral veins absent. Lower glume apex acuminate,

muticous. Upper glume lanceolate, 5–7 mm long, 0.5 length of adjacent fertile lemma, coriaceous, 1-keeled, keeled all along, 1 -veined. Upper glume primary vein eciliate or ciliate. Upper glume lateral veins absent. Upper glume apex acuminate, muticous.

Florets. Fertile lemma elliptic, 6–8 mm long, chartaceous, keeled, 5 -veined, more than 3-veined. Lemma surface pubescent or pilose. Lemma apex acute. Palea keels ciliate, with 1–10 enations per keel. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 4.5–5 mm long. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, oblong, sulcate on hilar side, hairy at apex, apex fleshy. Embryo 0.2 length of caryopsis. Hilum linear, 1 length of caryopsis.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. Pakistan.

Agropyropsis lolium (Balansa) A. Camus. *Bull. Soc. Bot. France* 82: 11 (1935).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Algeria. **Basionym or Replaced Name:** *Festuca lolium* Balansa ex Coss. & Durieu. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *B.Balansa* 721, 26 Jun 1853, Algeria: Batna, dans les prairies (US-91409 (fragm.)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): resembling *Lolium* with respect to the inflorescence.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations flabellate. Culms erect, 20–60 cm long. Ligule an eciliate membrane. Leaf-blades conduplicate, 2–17 cm long, 2–5 mm wide, coriaceous. Leaf-blade margins scabrous. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 8–26 cm long. Rhachis fragile at the nodes, semiterete. Spikelet packing broadside to rhachis, lax. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 3–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, falling entire, deciduous with accessory branch structures, readily shedding fertile florets. Rhachilla internodes 1–1.7 mm long.

Glumes. Glumes collateral, similar, shorter than spikelet, firmer than fertile lemma. Lower glume oblong, 4.5–7 mm long, 1 length of upper glume, coriaceous, without keels, 5 -veined. Lower glume lateral veins ribbed. Lower glume apex obtuse. Upper glume oblong, 4.5–7 mm long, 1–1.4 length of adjacent fertile lemma, coriaceous, without keels, 5 -veined. Upper glume lateral veins ribbed. Upper glume apex obtuse.

Florets. Fertile florets with the lowest dissimilar (1–3 veined). Fertile lemma elliptic, 4.5–5 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma apex obtuse. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 3, 3 mm long. Ovary glabrous. Caryopsis with adherent pericarp, oblong, dorsally compressed, 2–3 mm long. Hilum elliptic.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northern Africa. Algeria, Tunisia.

Agrostis agrostiflora (Beck) Janchen & Neumayer. *Wien. Bot. Zeitschr.* 93: 79 (1944).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Switzerland. **Basionym or Replaced Name:** *Arundo tenella* Schrad., *Fl. Germ.* 220 (1806), *Calamagrostis agrostiflora* (Schrad.) Beck, *Gram.* 4 t. 50. (1809). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Europe: alpius Tyrolensibus Helvetiae, *Darcot*.

Recent Synonyms: *Agrostis schraderiana* Becherer, *Wien. Bot. Zeitschr.* 93: 79 (1944).

Illustrations (Books): G.Hegi, *Flora von Mitteleuropa* 1 (1909) (as *Calamagrostis tenella*).

Derivation (Clifford & Bostock 2007): *L. flos*, flower. Spikelets *Agrostis* -like.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect or geniculately ascending, 30–70 cm long. Culm-internodes smooth. Ligule an eciliate membrane, 2–3 mm long. Leaf-blades 2–5 mm wide. Leaf-blade surface scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 7–15 cm long. Primary panicle branches appressed. Panicle branches terete, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 2.5–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded. Floret callus hairs 0.5 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong or ovate, 1.6–2.3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 4 -fid, truncate, muticous or awned, 1 -awned. Principal lemma awn subapical, straight, 0.5–1 mm long overall. Palea 0.25 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Europe.

Region. Middle Europe, Southwestern Europe, Southeastern Europe.

Country /Province /State. : Austria, Germany, Switzerland. : France. : Italy, Yugoslavia.

Agrostis alpina Scop. *Fl. Carn.* ed.2 .1: 60. (1772).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Germany. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Balkans.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. alpes*, high mountain; *-ina*, belonging to. Species growing at high altitudes.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 10–40 cm long. Culm-internodes smooth. Lateral branches lacking. Leaf-sheaths without keel, smooth, glabrous on surface. Ligule an eciliate membrane, 3–4 mm long, acute. Leaf-blades filiform, conduplicate or involute, 6–12 cm long, 0.3–0.4 mm wide, mid-green or glaucous. Leaf-blade surface puberulous, hairy adaxially. Leaf-blade apex acute, callose.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or ovate, 2–8 cm long. Panicle axis smooth. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 4–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.6 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 4–5 mm long, 1.2 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acute. Upper glume lanceolate, 3.5–4.5 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth or scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 4 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface scaberulous. Lemma apex dentate, 2 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 7–9 mm long overall, with twisted column. Palea 1 mm long, 0.25 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

$2n = 14$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Europe, Africa.

Region. Middle Europe, Southwestern Europe, Southeastern Europe, Eastern Europe.

Country /Province /State. : Austria, Czechoslovakia, Germany, Poland, Switzerland. : France, Spain. : Italy, Romania, Yugoslavia. Northwest European Russia, Ukraine. **Northern Africa.** Morocco.

Agrostis ambatoensis M.E. Astegiano. *Bol. Soc. Argent. Bot.*, 20: 271 (1982).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Argentina, Sierra de Ambato: Hunziker 20880.

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina 3 – 2 Pooideae* (2012) (105).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Serra de Ambato, Catamarca Province, Argentina.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms 3–5 cm long, 1 -noded. Culm-internodes distally glabrous. Lateral branches lacking. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 0.2–0.3 mm long, erose. Leaf-blades flat or conduplicate, 1–2 cm long, 0.5 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle, comprising 7–9 fertile spikelets. Panicle open, oblong, 1–2 cm long, bearing few spikelets. Primary panicle branches 3–6 in number. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 0.4–1.5 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.8–2.2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 2–2.2 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.8–2.1 mm long, 1.5–1.7 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.2–1.3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.66 way up back of lemma, straight, 0.6–1 mm long overall, not or scarcely exerted from spikelet. Palea 0.2 mm long, hyaline, 0 -veined.

Flower and Fruit. Lodicules 2, 0.2 mm long, membranous. Anthers 3. Caryopsis with adherent pericarp, ellipsoid, 1 mm long. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. **Southern South America.** Argentina Northwest. Catamarca.

Agrostis anadyrensis Soczawa. *Flora URSS* 2: 176, t. 13, f. 8 a-d, 746. 1934.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Belaya R. basin, Bitcho hills: Sochava (LE holo).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 24 Poaceae*, part 1 (2007) (645).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From the banks of the Anadyr' River, Eastern Siberia.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms erect, 35–40 cm long. Ligule an eciliate membrane, 2–3.5 mm long, obtuse. Leaf-blades 10 cm long, 3–4 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 10–15 cm long, 1–2 cm wide. Primary panicle branches appressed. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2.5 mm long, 1.2 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2 mm long, 1.2–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.5–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 2–2.5 mm long overall, with twisted column. Palea hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.6–0.7 mm long. Caryopsis with adherent pericarp. Hilum linear.

$2n = 56$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Siberia, Russian Far East. Krasnoyarsk. Kamchatka, Magadan, Sakhalin.

Agrostis angrenica (Butk.) Tsvelev. *Novosti Sist. Vyssh. Rast.*, 8: 59 (1971).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. **Basionym or Replaced Name:** *Pentatherum angrenicum* Butkov, *Journ. Bot. URSS*, 28: 243 (1943). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Tianshan, Arshan: Zakirov (TAK holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ica*, belonging to. From the Angren Basin, Central Asia.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms erect or geniculately ascending, 20–30 cm long, 1–2 -noded. Culm-internodes smooth. Leaf-sheaths 4–6 cm long, smooth. Ligule an eciliate membrane, 2 mm long, pubescent on abaxial surface, lacerate. Leaf-blades 2.5–4 cm long, 2–2.5 mm wide. Leaf-blade surface scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, linear or lanceolate, 3–7 cm long, 1–1.5 cm wide. Primary panicle branches appressed, 1–4 -nate, 0.5–1.8 cm long. Panicle branches with occasional prickles. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–2.2 mm long, breaking up at

maturity, disarticulating below each fertile floret. Floret callus pilose. Floret callus hairs 0.5 length of lemma.

Glumes. Glumes persistent, similar, reaching apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2–2.2 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface smooth or asperulous, rough above. Lower glume apex acute. Upper glume lanceolate, 2–2.2 mm long, 1 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface smooth or asperulous, rough above. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 2–2.2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface puberulous. Lemma apex dentate, 4 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight or curved, 3–3.5 mm long overall. Palea 1.5 mm long, 0.75 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.2 mm long. Caryopsis with adherent pericarp, ovoid, 1.5 mm long. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Middle Asia. Kirgizistan.

Agrostis arisan-montana Ohwi. *Acta Phytotax. & Geobot.* 1933, 2 :161 (1933).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Taiwan: Tainan, Mt. Arisan, 3 July 1933, *J. Ohwi* 3463 (HT: KYO; IT: K, LE, US-1964403).

Illustrations (Books): C-C Hsu, *Flora of Taiwan*, Vol 5 (1978) (240), C-C Hsu, *Taiwan Grasses* (1975) (399, Pl. 1375), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 467).

Derivation (Clifford & Bostock 2007): *L. mons*, mountain; *-ana*, indicating connection. From Mt. Arisan, Taiwan.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms geniculately ascending, 40–100 cm long, 1–1.7 mm diam., 3–6 -noded, rooting from lower nodes. Leaf-sheaths smooth. Ligule an eciliate membrane, 2–3.5 mm long, scaberulous on abaxial surface, obtuse. Leaf-blades 5–14 cm long, 2–6 mm wide. Leaf-blade surface scaberulous, rough on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate or oblong, 10–20 cm long. Primary panicle branches ascending or spreading, 3 -nate, 5–8 cm long, bearing spikelets almost to the base. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 1.9–2.3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume ovate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume ovate, 1.9–2.3 mm long, 1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong or ovate, 1.4–1.7 mm long, hyaline, without keel, 4–5 -veined, more than 3-veined. Lemma apex erose, obtuse, mucicous. Palea 0.35–0.75 mm long, 0.2–0.4 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Anthers 3, 0.5–0.8 mm long.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China, Eastern Asia. China South Central, Inner Mongolia, China North-Central, China Southeast. Taiwan.

Shaanxi, Guangxi, Henan, Sichuan, Yunnan.

Agrostis aristiglumis Swallen. Leafl. West. Bot. 5: 56 (1947).

Accepted by: U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.T. Howell 23149*, 14 May 1947, USA: California: Marin Co.: Drakes estero WNW of Mt Vision (US-1869693; IT: NY-327617; S-G244, US-2181110, US-32156277). S specimen has correct date, but coll. no. of 1411.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. arista*, bristle; *gluma*, husk. With awned subtending glumes or lemmas.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 5–15 cm long. Leaf-sheaths longer than adjacent culm internode. Ligule an eciliate membrane, 2–2.5 mm long. Leaf-blades 1.5–6 cm long, 0.5–2.3 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, 3–6 cm long, 0.5–0.8 cm wide. Primary panicle branches appressed, 0.5–2 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.5–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose. Floret callus hairs 0.15 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic, 3.5–4 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acuminate, awned, 1 -awned, awn 1–2 mm long. Upper glume elliptic, 3.5–4 mm long, 1.1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume surface asperulous. Upper glume apex acuminate, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma oblong, 3.2–3.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5–0.6 way up back of lemma, geniculate, 6–7 mm long overall, with twisted column. Palea 0.3 length of lemma, hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southwestern USA. California.

Agrostis arvensis Phil. *Linnaea* 29: 87. (1858).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: *R. Moran 29504*, 4 Apr 1981, Mexico: Socorro I. (US-3170268).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. arvum*, arable field; *-ensis*, denoting origin. Uncultivated species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, culms solitary. Rhizomes elongated. Culms geniculately ascending, slender, 35–50 cm long, 2–3 -noded. Culm-internodes distally glabrous. Lateral branches lacking. Leaves cauline. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 0.4–1 mm long, erose, obtuse. Leaf-blades 4–8 cm long, 0.5–0.6 mm wide. Leaf-blade surface smooth.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 5–9 cm long, 0.3–0.5 cm wide. Primary panicle branches appressed. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 0.5–3 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.1–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.1–2.5 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.4–1.7 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, muticous. Palea 0.5–0.6 mm long, 0.33 length of lemma, 0 -veined.

Flower and Fruit. Lodicules 2, 0.3 mm long, membranous. Anthers 3, 1.1–1.3 mm long. Caryopsis with adherent pericarp. Endosperm farinose.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Chile Central.

Rest of Chile- Biobio, La Auracania, Maule, O'Higgins, Santado, Valpariso. Biobio.

Agrostis atlantica Maire & Trabut. *Bull. Soc. Hist. Nat.Afr. Nord.* 15: 392 (1924).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Morocco. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Morocco, Reraya: Litardiere & Maire ; Morocco, Ourika: Maire.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): from the Atlantic coast of North Africa.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 10–40 cm long. Culm-internodes smooth. Leaf-sheaths without keel, smooth, glabrous on surface. Ligule an eciliate membrane, 2–3 mm long, erose or lacerate, obtuse. Leaf-blades conduplicate, 3–7 cm long, 1–1.3 mm wide. Leaf-blade venation with 7–9 secondary veins, 3–5 inner ridges. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade margins scabrous. Leaf-blade apex obtuse or abruptly acute.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 4–7 cm long. Primary panicle branches ascending or spreading, 4–6 -nate. Panicle axis smooth. Panicle branches capillary, smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, smooth or scaberulous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–2.25 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.25 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume oblong, 2–2.75 mm long, 1.2 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume oblong, 1.75–2.5 mm long, 1.2 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.6–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent (0.3mm). Lemma surface pilose. Lemma apex dentate, 2 -fid, truncate or obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33–0.5 way up back of lemma, geniculate, 2–3 mm long overall, with twisted column. Palea 0.25–0.33 length of lemma, hyaline.

Flower and Fruit. Lodicules absent. Anthers 3, 1.5–2 mm long, yellow. Caryopsis with adherent pericarp, oblong, sulcate on hilar side, 1–1.2 mm long. Embryo 0.25–0.33 length of caryopsis. Hilum elliptic.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northern Africa. Morocco.

Agrostis australiensis Mez. Fedde, *Repert.* 17: 302 (1921).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, D.Sharp, D. & B.K.Simon, *AusGrass* (2002), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.H. Maiden & W. Forsyth s.n.*, 1899, Australia: New South Wales, Mt. Kosciusko (B; IT: US-75369 (fragm. ex B)).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (109).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Australia.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose, clumped densely. Culms erect, slender, 8–20 cm long, 2-noded. Leaves basal and cauline. Leaf-sheaths longer than adjacent culm internode, striately veined, scaberulous. Ligule an eciliate membrane, 2 mm long, obtuse. Leaf-blades aciculate, 1–3 cm long, 1 mm wide, stiff. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle open, pyramidal. Primary panicle branches 2–3-nate. Panicle branches capillary, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2.3–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 2.3–3 mm long, 1.1 length of upper glume, membranous, purple, 1-keeled, 1-veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume margins ciliolate. Lower glume apex acute. Upper glume lanceolate, 2–2.7 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1-veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume margins ciliolate. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 1.7–2 mm long, hyaline, without keel, 5-veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma surface asperulous. Lemma apex truncate, muticous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.3–0.4 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, A.C.T., Victoria, Tasmania. Tablelands.

Agrostis bacillata Hack. *Oesterr. Bot. Zeitschr.* 1902, 59. (1902).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Costa Rica. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *H. Pittier 10477*, Jan 1897, Costa Rica: Cerro de la Muerte (W; IT: US-365913, US-820229, US-75436 (fragm.)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. bacillus*, rod; *-ata*, possessing. The rhachilla projects beyond the floret.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 10–30 cm long, 0.2–0.3 mm diam., 1–2-noded. Culm-nodes purple. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 1.7–4.3 mm long, acuminate. Leaf-blades filiform, conduplicate, 2–15 cm long, 0.2–0.8 mm wide. Leaf-blade surface ribbed, scaberulous, rough abaxially.

Inflorescence. Inflorescence a panicle. Peduncle 2–6 cm long. Panicle open, oblong, 4–11 cm long, 3–5 cm wide. Primary panicle branches 2-nate. Panicle branches flexuous. Spikelets spreading, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 1.8–2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume oblong, 1.8–2 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 3 -veined. Lower glume primary vein scaberulous. Lower glume apex acute. Upper glume oblong, 1.8–2 mm long, 1.1 length of adjacent fertile lemma, membranous, purple, 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.6–1.8 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, obtuse, mucicous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.66 way up back of lemma, straight, 0.3–0.6 mm long overall. Palea 1.1–1.4 mm long, 0.66–0.75 length of lemma, hyaline. Rhachilla extension 1.1–1.4 mm long.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.8–1 mm long. Caryopsis with adherent pericarp. Hilum linear.

$2n = 28$ (2 refs TROPICOS).

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Costa Rica, Panama.

Agrostis balansae (Boiss.) Tsvelev. *Novit. Syst. Pl. Vasc., Acad. Sci. URSS*, 6: 20 (1970).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Turkey. **Basionym or Replaced Name:** *Calamagrostis balansae* Boiss., *Fl. Orient.* 5: 522 (1884). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Turkey, Ponto Lazico: Balansa (G syn) ; Turkey, Khabackar: Balansa sn (G syn).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Benjamin Balansa (1825–1892) French botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect or geniculately ascending, 28–75 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 3–4.5 mm long, obtuse. Leaf-blades 4–27 cm long, 3–6 mm wide. Leaf-blade surface glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 5.5–15 cm long, 1.5–3 cm wide. Primary panicle branches appressed, 2.5–5 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 1–3 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose. Floret callus hairs 0.7–1 mm long, 0.4 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3–3.5 mm long, 1.5 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 2–2.3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface glabrous or pubescent. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1–0.2 way up back of lemma, geniculate, 3.2–4 mm long overall, with twisted column. Palea 0.33 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.2–1.4 mm long. Stigmas 2, laterally exerted. Caryopsis with adherent pericarp, 1.3–1.6 mm long. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Caucasus, Western Asia. North Caucasus, Transcaucasus. Turkey.

Agrostis barbuligera Stapf. In Dyer, *Fl. Cap.* 7: 548. (1899).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. basis*, base; *-alis*, pertaining to. Lemma awned from near the base.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms slender, 45 cm long. Culm-internodes smooth. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 4 mm long, scaberulous on abaxial surface, obtuse. Leaf-blades flat or involute, 5–8 cm long, 2 mm wide. Leaf-blade surface scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 11–12 cm long. Primary panicle branches ascending. Panicle branches glabrous. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous or sparsely hairy.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3–3.5 mm long, 1.1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 2.8–3 mm long, 1.6 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma ovate, 1.8–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 3–3.5 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Agrostis bergiana Trin. *Gram. Unifl.* 203. (1824).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006) (& as *A. capensis*).

TYPE from South Africa. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: T?: Ecklon 242, Cape ("Table mountain") (S-G246).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Karl Heinrich Bergius (1790–1818) German naturalist and apothecary who collected at Cape Town, South Africa.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual or perennial, short-lived. Culms weak, 15–30 cm long. Ligule an eciliate membrane. Leaf-blades 2–9 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 6–15 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 5–10 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.5–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, reaching apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.5–2.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.5–2.5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.5–2.5 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma surface glabrous. Lemma apex dentate, 4 -fid, truncate, muticous or awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight or curved, 0–2 mm long overall, without a column. Palea 0.9 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa, Middle Atlantic Ocean. Mpumalanga, Free State, Kwazulu-Natal, Lesotho, Western Cape. St Helena.

Agrostis bettyae S.W.L.Jacobs. *Telopea* 9(3): 679 (2002).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: New South Wales: Southern Tablelands, Tallong [as ?Tallwong], Jan 1900, W. Forsyth NSW-506461 (HT: NSW; IT: US).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler,, *Grasses of New South Wales*, 4th edn (2008) (109).

Derivation (Clifford & Bostock 2007): in honor of Betty Jacobs (1947-) Australian Tertiary Educator.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Rhizomes absent or short. Culms erect or geniculately ascending, 50–90 cm long, 4 -noded. Leaf-sheaths smooth or scaberulous. Ligule an eciliate membrane, 2–5 mm long, erose. Leaf-blades flat or involute, 1.5–4 mm wide. Leaf-blade surface ribbed, grooved adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or ovate, loose, 10–35 cm long, with spikelets clustered towards branch tips. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 2–2.5 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 1 -

veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–2.5 mm long, 1.2–2.6 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma oblong, 1.25–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex emarginate or truncate, muticous. Palea absent or minute.

Flower and Fruit. Anthers 3, 0.8 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland, New South Wales. Tablelands.

Agrostis blasdalei Hitchcock. *Proc. Biol. Soc. Wash.* 41: 160. (1928).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.B. Davy & W.C. Blasdale 6159*, May 1899-Aug 1899, USA: California: Mendocino Co., near Ft. Bragg, on cliffs (US-556266).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (657).

Derivation (Clifford & Bostock 2007): in honor of Walter Charles Blasdale (1871-) United States amateur botanist and chemist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending or decumbent, 10–15 cm long, 2–3 -noded. Lateral branches lacking. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1–1.5 mm long. Leaf-blades filiform, conduplicate or involute, 2–4 cm long, 0.5 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted or spiciform, linear, 2–3 cm long. Primary panicle branches appressed. Panicle axis scabrous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 2.5–3 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex acuminate. Upper glume lanceolate, 2.5–3 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface scabrous. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, 1.8 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight, 1 mm long overall. Palea 0.3 mm long, 0.1–0.2 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.75–1.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southwestern USA. California.

Agrostis boliviana Mez. *Fedde, Repert.* 18: 1 (1922).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Fiebrig 2821*, Bolivia: Pinos bei Tarija (B; IST: BAA, US-1127226 (fragm. ex B)).

ST: *Fiebrig 2905*, Bolivia: Calderillo (B; IST: BAA, US-1127227 (fragm. ex B)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating location. From Bolivia.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 25–75 cm long. Ligule an eciliate membrane, 4–5 mm long. Leaf-blades involute, 2–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 10–15 cm long. Primary panicle branches ascending or spreading, whorled at most nodes. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 2.5 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia, Peru.

Agrostis boormanii Vickery. *Contrib. N. S. Wales Nat. Herb.* 1: 105 (1941).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New South Wales: Harvey Ranges, Peak Hills, *J.L. Boorman, K, 11.1905* (K, NSW).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler,, *Grasses of New South Wales*, 4th edn (2008) (109).

Derivation (Clifford & Bostock 2007): in honor of John Luke Boorman (1864–1938) Australian plant collector.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, slender, 30 cm long, 1–2 -noded. Culm-internodes smooth or scaberulous. Culm-nodes glabrous. Leaf-sheaths scaberulous. Ligule an eciliate membrane, 3 mm long, lacerate, obtuse. Leaf-blades filiform or linear, 5–10 cm long, 1–1.5 mm wide. Leaf-blade surface scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate. Primary panicle branches appressed, 2–5 -nate, bearing spikelets almost to the base. Panicle branches capillary, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 2 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface smooth or asperulous. Lower glume margins ciliolate. Lower glume apex acute. Upper glume lanceolate, 1.8 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume surface smooth or asperulous. Upper glume margins ciliolate. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 1.6 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex truncate, awned, 1 -awned. Principal lemma

awn dorsal, arising 0.5 way up back of lemma, geniculate, 3–4 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.3 mm long. Caryopsis with adherent pericarp, ellipsoid. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales.
Western Slopes.

Agrostis bourgaei E. Fourn. *Mexicanas Plantas* 2: 95. 1886.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: *Bourgeau* 682, 1865, Mexico: Mexico (P; IT: US-556238 (fragm. ex P)).

Recent Synonyms: *Agrostis thyrsgera* Mez, *Fedde, Repert.* 17: 301 (1921).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Eughne Bourgeau (1813–1877) French botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms geniculately ascending, 20–60 cm long. Lateral branches lacking. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 2–5 mm long. Leaf-blades 3–7 cm long, 1–3 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 5–25 cm long. Primary panicle branches appressed or ascending, whorled at most nodes. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 2 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex mucicous. Palea 0.25–0.33 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.75–1.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Central Mexico, Northeast Mexico, Southwest Mexico.
Distrito Federal, Mexico State, Tlaxcala. Guanajuato, Hidalgo. Michoacan, Oaxaca.

Agrostis boyacensis Swallen & Garcia-Barr. *Caldasia* 2(8): 303, f. A. 1943.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J. Cuatrecasas & H. Garcia-Barriga* 1459, 12 Sep 1938, Colombia: Boyaca: Nevada del Cocuy (US-1772992; IT: COL).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*. From Department of Boyaca, Colombia.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms erect, 6–22 cm long. Culm-internodes distally glabrous. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths longer than adjacent culm internode,

smooth or scaberulous, glabrous on surface. Ligule an eciliate membrane, 1.5–2 mm long, acute. Leaf-blades erect, flat or convolute, 3–5 cm long, 1.5–2 mm wide. Leaf-blade venation prominent. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 3–5 cm long. Primary panicle branches appressed or ascending, 1.5 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 2.5 mm long, 1.1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex obtuse, muticous. Palea absent or minute.

Flower and Fruit. Lodicules 2, 0.7 mm long, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Agrostis brachiata Munro ex Hook. f. *Fl. Brit. Ind.* 7: 256. (1896).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from Nepal. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Nepal; *Wallich 3769C* (HT: K; IT: K-W, E).

Recent Synonyms: *Agrostis megathyrsa* Keng ex P.C. Keng, *Bull. Bot. Res. North-East. Forest. Inst.* 4(3): 197 (1984).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 465).

Derivation (Clifford & Bostock 2007): *L. brachium*, forearm; *-atum*, possessing. Inflorescence a single axis bearing racemes often held in a manner suggesting the arms of a signalling station.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, slender, 60–100 cm long. Ligule an eciliate membrane. Leaf-blades 5–15 cm long, 2–6 mm wide, flaccid. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, effuse, 7–25 cm long. Primary panicle branches spreading, 3–5 -nate, whorled at most nodes. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 4–6 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, reaching apex of florets, firmer than fertile lemma. Lower glume elliptic, 1.5 mm long, 1 length of upper glume, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.5 mm long, 1 length of adjacent fertile lemma, membranous, without keels, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, muticous. Palea absent or minute.

Flower and Fruit. Anthers 3, 0.5 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, China North-Central. **Indian Subcontinent.** Eastern Himalaya, India, Nepal.

Gansu. Guizhou, Hubei, Sichuan, Yunnan. Bhutan. Bihar. West Bengal.

Agrostis brachyathera Steud. *Syn. Pl. Gram.* 422. (1854).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: W. Lechler 1236, Dec 1852, Chile: Magellan, prope Sandy Point (P; IT: BAA, K, LE, P, US-75334, W). W. Lechler pl. magellanica. R.F. Hohenacker..

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (106), M.N.Correra, *Flora Patagonica* Parte III, Gramineae (1978) (390, Fig. 260).

Derivation (Clifford & Bostock 2007): Gk. *brachys*, short; ather, ear or spike of wheat. Spikelet with a minute rachilla projection or lemma with a short awn.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–50 cm long. Leaf-sheaths smooth or scaberulous. Ligule an eciliate membrane, 2 mm long, erose, obtuse. Leaf-blades flat or convolute, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 5–12 cm long, contracted about secondary branches. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.9–3.2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, dark green, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acute. Upper glume lanceolate, 2.9–3.2 mm long, 1.5–1.6 length of adjacent fertile lemma, membranous, dark green, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.8–2.2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex awned, 1 -awned. Principal lemma awn dorsal, arising 0.66 way up back of lemma, straight, 1.2–2 mm long overall. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.75–0.8 mm long. Caryopsis with adherent pericarp, fusiform, 1.5 mm long. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina South, Chile Central, Chile South.

Tierra del Fuego. Rest of Chile- Biobio, La Auracania, Maule, O'Higgins, Santado, Valpariso, Chiloe, Aisen, Magellanes. Maule, Biobio. Aisen, Magellanes.

Agrostis breviculmis Hitchc. *U.S. Dept. Agric. Bull. Pl. Ind.* 68: 36 (1905).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Peru. **Basionym or Replaced Name:** *Trichodium nanum* J. Presl, *Reliq. Haenk.* 1(4–5): 243 (1830)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *T. Haenke s.n.*, Peru (LE-TRIN-1627.01 (fragm. & fig.)).

HT: *T. Haenke s.n.*, Peru (PR; IT: MO-2104691, MO-2104692 (illustration)).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (106), S.A.Renvoize, *Gramineas de Bolivia* (1998) (178, Fig. 43).

Derivation (Clifford & Bostock 2007): L. *brevis*, short; culmus, stalk. Culms short.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 4–10 cm long. Culm-internodes distally glabrous. Ligule an eciliate membrane. Leaf-blades involute, 1–3 cm long, 1–1.3 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 1–3 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous, rough above. Lower glume apex acute. Upper glume lanceolate, 1.8–2 mm long, 1.2–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface asperulous, rough at apex. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, muticous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Southern South America. Bolivia, Colombia, Ecuador, Peru. Chile Central.

Catamarca, Salta. Cordoba. Coquimbo, Santiago, Biobio, La Araucania.

Agrostis burmanica Bor. *Kew Bull.* 1957, 416 (1958).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960).

TYPE from Myanmar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *F. Kingdon-Ward 22,816*, 1956, Burma (K; IT: US-2238415 (fragm. ex K)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ica*, belonging to. From Burma, now Myanmar.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Butt sheaths papery. Culms 30–60 cm long. Culm-nodes glabrous. Ligule an eciliate membrane, 1.5–7 mm long. Leaf-blades 10–22 cm long, 2 mm wide. Leaf-blade surface scaberulous, rough on both sides, glabrous. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 8–16 cm long. Primary panicle branches 3–4 -nate. Panicle branches flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3–4.5 mm long, 1 length of upper glume, membranous, 1-keeled, keeled above, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3–4.5 mm long, 1.4–1.5 length of adjacent fertile lemma, membranous, 1-keeled, keeled above, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 2–2.5 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma margins ciliate. Lemma apex awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 5 mm long overall, with twisted column. Palea 2 mm long, 0.8–1 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.3–1.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Tropical Asia.
Country /Province /State. Indo-China. Myanmar.

Agrostis calderoniae Acosta Cast. *Phytologia* 62(6): 449, f. 1. 1987.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mexico: Mexico: Mun. Tlalmanalco: La Cienaga, region de Penas Cuatas, ladera NW del Ixtaccihuatl, 3600 m, 19 Aug 1984, S. Acosta 687 (HT: ENCB; IT: CHAPA, MEXU, TEX).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ella*, diminutive but here a name-forming suffix; L. *-ana*, indicating connection. In honor of Cleofi Elsa Caldersn (1929-) Argentine-born United States botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms erect, 15–38 cm long. Lateral branches lacking. Leaf-sheaths antrorsely scabrous. Ligule an eciliate membrane, 1.5–4 mm long. Leaf-blades filiform, involute, 2–10 cm long, 1–2 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, loose, 5–10 cm long, 2–9 cm wide. Primary panicle branches ascending, branching divaricately, rebranched at middle, 2–5 cm long. Panicle branches flexuous, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 2.5–3.5 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.5–3.5 mm long, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface glabrous. Lemma apex obtuse, mucicous. Palea 0.7–1 mm long, 0.33 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.7 mm long, membranous. Anthers 3, 0.5–0.7 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Central Mexico.
Mexico State.

Agrostis canina L. *Sp. Pl.* 62. (1753).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006) (& as *A. pallida*, *A. tenuis*), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983) (& as *A. tenuis*), T.Koyama, *Grasses of Japan and its neighboring regions* (1987), W.D.Clayton & N.Snow, *Key to Pacific Grasses* (2010).

TYPE from Europe. **Basionym or Replaced Name:** *Agrostis tenuifolia*, Curt. *Brit. Gr.* 42 (1787). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: CT: Herb. Burser I: 3 (UPS). LT designated by *Widin, Fl. Fenn.* 5: 29 (1971); CT proposed by Jarvis, *Taxon* 41: 556 (1992).

Recent Synonyms: *Agrostis tenuis* Bast. ex Roem. & Schult., in syn, *Syst.* 2: 277 (1817).

Illustrations (Books): C.E.Hubbard, *Grasses* (1968) (296 & 300 also as *A. tenuis*), T. Cope & A. Gray, *Grasses of the British Isles* (96), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (642), L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (476, Fig. 102 as *A. tenuis*), E.Hafliger & E.Schultz, *Grass Weeds*, CIBA-GEIGY (2:7(1980)).

Derivation (Clifford & Bostock 2007): *L. canus*, greyish-white; -inus, belonging to. Foliage or inflorescences grey-green.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent or elongated. Stolons present. Culms geniculately ascending or decumbent or prostrate, 15–75 cm long, 1–4 -noded, without nodal roots or rooting from lower nodes. Culm-internodes smooth. Leaf-sheaths without keel, smooth or scaberulous. Ligule an eciliate membrane, 1–5 mm long, acute. Leaf-blades flat or convolute, 2–15 cm long, 1–3 mm wide. Leaf-blade surface ribbed, scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, lanceolate or ovate, 2–10 cm long, 1–7 cm wide. Primary panicle branches whorled at most nodes. Panicle branches capillary, terete, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 1–3 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 1.7–3.3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1–1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous (above). Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong or ovate, 1.1–2.1 mm long, hyaline, without keel, 4–5 -veined, more than 3-veined. Lemma apex truncate, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 2–4.5 mm long overall, with twisted column. Palea oblong, 0.1–0.25 length of lemma, hyaline, 2 -veined. Palea apex obtuse.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 1–1.5 mm long. Stigmas 2, laterally exerted. Caryopsis with adherent pericarp, ellipsoid, isodiametric, biconvex, estipitate, without sulcus, smooth, apex unappendaged. Embryo 0.2 length of caryopsis. Hilum linear, 0.9 length of caryopsis. Endosperm farinose.

$n = 14$ (1 ref TROPICOS), or 21 (1 ref TROPICOS). $2n = 14$ (5 refs TROPICOS), or 28 (2 refs TROPICOS).

Distribution (TDWG). **Continent.** Europe, Africa, Temperate Asia, Tropical Asia, Pacific, North America (*), South America, Antarctica.

Derivation (Clifford & Bostock 2007): *L. capillis*, a hair; *-are*, pertaining to. Inflorescence with filiform branches.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Stolons absent or present. Culms erect or geniculately ascending, 10–70 cm long, 2–5 -noded. Culm-internodes smooth. Leaf-sheaths without keel, smooth. Ligule an eciliate membrane, 0.5–2 mm long (shorter than wide), truncate. Leaf-blades 1–15 cm long, 1–5 mm wide. Leaf-blade surface ribbed, smooth or scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, oblong to ovate, 1–20 cm long, 1–12 cm wide. Primary panicle branches whorled at lower nodes. Panicle branches capillary, terete, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 1–3 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 2–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1–1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.3–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic to oblong, 1.2–2.7 mm long, hyaline, without keel, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma apex truncate. Palea oblong, 0.5–0.7 length of lemma, hyaline, 2 -veined. Palea apex obtuse.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 1–1.5 mm long. Stigmas 2, laterally exserted. Caryopsis with adherent pericarp, ellipsoid, isodiametric, biconvex, estipitate, without sulcus, 1 mm long, smooth, apex unappendaged. Embryo 0.2 length of caryopsis. Hilum linear, 0.9 length of caryopsis. Endosperm farinose.

Agrostis carmichaelii Roem. & Schult. *Mant.* 3: 571 (1827).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Tristan da Cunha. **Basionym or Replaced Name:** *Agrostis ramulosa* Carm., non (Kunth)Roem. & Schult.(1817), *Trans. Linn. Soc.* 12: 504 (1818). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: : Based on *A. ramulosa* Carm. ; Tristan da Cunha: Coll??.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Dugald Carmichael (1772–1827) Hebridean-born British soldier and plant collector.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, cushion forming, clumped densely. Culms 4–7(–12) cm long. Ligule an eciliate membrane, 1 mm long, acute. Leaf-blades filiform, convolute, 2–4 cm long, 0.5 mm wide. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, shorter than basal leaves, embraced at base by subtending leaf. Panicle open, linear or oblong, 1–1.5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, mucicous. Palea 0.33 length of lemma, hyaline.

Distribution (TDWG). Continent. Antarctica.

Country /Province /State. Subantarctic islands. Tristan de Cunha.

Agrostis castellana Boiss. & Reut. *Diagn. Hisp.* 26. (1842).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Spain. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: Reuter s.n., Jun 1841, Spain: Matvita: in collibus arenosis (LE). Reuter misit Jul. 1842.

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (108), T. Cope & A. Gray, *Grasses of the British Isles* (99), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (640), S.A.Rennoize, *Gramineas de Bolivia* (1998) (176, Fig. 42).

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating location. From the Spanish Provinces of New and Old Castille.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect or geniculately ascending, 18–50 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1–3.5 mm long. Leaf-blades involute, 2.5–10 cm long, 0.5–1.8 mm wide. Leaf-blade surface smooth or scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, effuse, 5–15 cm long, 0.8–6 cm wide. Primary panicle branches spreading, 4–8 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 1–2.3 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension or with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.3–3.7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.3–3.7 mm long, 1.4–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.6–1.8 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma apex erose, truncate, mucicous. Palea 0.5 length of lemma, hyaline, 2 -veined. Rhachilla extension pilose.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Stigmas 2, laterally exerted. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). **Continent.** Europe, Africa, Temperate Asia, Australasia, South America, Antarctica.

Region. Northern Europe (*), Southwestern Europe, Southeastern Europe.

Country /Province /State. : Great Britain. : Corsica, France, Portugal, Spain. : Albania, Bulgaria, Greece, Italy, Yugoslavia. **Northern Africa, Macaronesia.** Morocco. Agrostis clavata Trin. Spreng. *Neue Entdeck.* 2: 55. (1821).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Kamchatka: Fischer 46 (LE holo).

Illustrations (Books): C-C Hsu, *Flora of Taiwan*, Vol 5 (1978) (242), C-C Hsu, *Taiwan Grasses* (1975) (as ssp. *matsumurae*), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (646), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 464).

Derivation (Clifford & Bostock 2007): L. *clava*, club; ata, possessing. Possibly a reference to the obtuse lemma.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Basal innovations intravaginal. Culms erect or geniculately ascending, 30–70 cm long, 2–3 -noded. Culm-internodes smooth. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 1.5–3 mm long, obtuse or acute. Leaf-blades 9–18 cm long, 2–7 mm wide, dark green. Leaf-blade venation with 10–30 secondary veins. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 8–25 cm long, 0.25–0.33 of culm length, bearing few spikelets. Primary panicle branches spreading, whorled at lower nodes, rebranched above middle, 4.6–7.5 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, clavate, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 1.6–2.8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 1.6–2.8 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acuminate. Upper glume lanceolate, 1.6–2.8 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 1.3–1.9 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma surface smooth. Lemma apex dentate, obtuse, muticous. Palea present or absent or minute, 0.2–0.5 mm long, 0–0.25 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.3–0.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

$2n = 42$ (2 refs TROPICOS).

Distribution (TDWG). Continent. Europe, Temperate Asia, Tropical Asia, North America.

Region. Northern Europe, Eastern Europe.

Country /Province /State. : Finland, Sweden. Central European Russia, East European Russia, North European Russia, Northwest European Russia. Siberia, Russian Far East, **Caucasus, China, Mongolia, Eastern Asia, Russia.** Altay, Buryatiya, Chita, Irkutsk, Krasnoyarsk, Tuva. Kamchatka, Kuril Is, Sakhalin. North Caucasus. China South Central, Inner Mongolia, Manchuria, China North-Central, China Southeast, Tibet. Mongolia. Japan, Korea, Taiwan. **Malesia, Papuasias.** New Guinea PNG. New Guinea. **Subarctic America.** Alaska, Yukon, Northwest Territories.

Gansu, Hebei, Shaanxi, Shandong, Anhui, Fujian, Guangdong, Henan, Guizhou, Sichuan, Yunnan.

Agrostis clemensorum Bor. *Journ. Ind. Bot. Soc.* 42 A. 12 (1963).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, J.F.Veldkamp, Poaceae ms (*Flora Malesiana*).

TYPE from Indonesia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Clemens 30438*, 7–9 Sep 1932, Indonesia: Java: G. Gede, under the structure at the summit, 10000 ft, forest, leaves and stem rigid (K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Joseph (1862–1935) English-born United States missionary in southeast Asia and Mary Knapp Strong Clemens.

Classification. Subfamily Pooideae. Tribe: Poaeae.

Habit, Vegetative Morphology. Perennial. Cataphylls evident. Basal innovations extravaginal. Culms decumbent, 20–40 cm long, rooting from lower nodes. Leaf-sheaths smooth. Ligule an eciliate membrane, 1.25–2 mm long, truncate. Leaf-blades 10–17.5 cm long, 4–5 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 4–9 cm long, 0.6–1.5 cm wide. Primary panicle branches appressed, naked below or bearing spikelets almost to the base. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 1.65–1.85 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume elliptic, 1.65–1.85 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume elliptic, 1.4–1.5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.5–1.6 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure, extending close to apex. Lemma apex entire, acute, muticous. Palea 0.5 mm long, 0.33 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.8–0.9 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Malesia. Java.

Agrostis comorensis A. Camus. *Bull. Soc. Bot. France* 78: 34 (1931).

TYPE from Comores Is. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Comares Isl. Africa.

Illustrations: None found.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms erect, 50 cm long, 2 -noded. Culm-internodes distally glabrous. Leaf-sheaths striately veined, glabrous on surface. Ligule an eciliate membrane, 4 mm long. Leaf-blades erect, 10–20 cm long, 1.5 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 11–15 cm long, 0.5–1 cm wide. Primary panicle branches 3 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1.5–3 mm long, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.4 mm long, 0.17 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 4 mm long, 1.1 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 3.7 mm long, 1.5 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 2.4 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma surface puberulous. Lemma apex dentate, truncate, awned, 2 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight or curved, 4 mm long overall. Palea 1.8 mm long, 0.75 length of lemma, hyaline.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Comoros.

Agrostis congestiflora Tutin & E. F. Warb. *Journ. Bot* 70: 43 (1932).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Azores. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: : Based on *Deyeuxia caespitosa* ; Azores, Pico: Hochstetter 188 (K iso).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. congesta*, crowded together; flos, flower. Panicle branches erect at anthesis.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending, 5–35 cm long. Culm-internodes smooth or scaberulous. Ligule an eciliate membrane, 0.5–5 mm long. Leaf-blades flat or involute, 1–10 cm long, 0.5–4 mm wide. Leaf-blade surface scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 2–6 cm long. Primary panicle branches appressed. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 1 length of fertile spikelet, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 2–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous or sparsely hairy. Floret callus hairs 0–0.3 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth or scaberulous. Lower glume lateral veins absent. Lower glume apex acute, mucous or mucronate. Upper glume lanceolate, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute, mucous or mucronate.

Florets. Fertile lemma elliptic to oblong, 1.3–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins prominent, excurrent or extending close to apex. Lemma surface smooth or scaberulous, glabrous or pubescent. Lemma apex obtuse, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.33–0.5 way up back of lemma, geniculate, 2–4 mm long overall, with twisted column. Palea 0.6–0.8 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 0.6–1 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Europe, Africa.

Region. Southwestern Europe.

Country /Province /State. Macaronesia. Azores.

Agrostis contracta Y.C. Tong ex Y.C. Yang, non Hook f. (1860). *Bull. Bot. Res. North-East. Forest. Inst.*, 4(4): 100 (1984).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Yunnan, Bijiang Xian: Coll. 58618.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. contracta*. Inflorescence a narrow panicle.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms 30–50 cm long, 1–1.5 mm diam., 3–4 -noded. Culm-internodes scaberulous. Leaves cauline. Ligule an eciliate membrane, 1–2 mm long, truncate. Leaf-blades 10–13 cm long, 3–5 mm wide. Leaf-blade surface scabrous. Leaf-blade margins scabrous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 10–15 cm long, 3 cm wide. Primary panicle branches 5–10 -nate, whorled at most nodes. Panicle branches smooth, glabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, smooth, glabrous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2.5–3 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.5–3 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5–1.7 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.66–0.75 way up back of lemma, geniculate, 3 mm long overall, with twisted column. Palea 0.3 mm long, 0.2 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, oblong, 0.6 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central.

Yunnan.

Agrostis curtisii Kerguelen. *Lejeunia*, 75 (Err. / Corr.): 1 (1975).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from UK. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: : Based on *A. setacea* Curtis ; Britain, London: Curtis.

Illustrations (Books): C.E.Hubbard, *Grasses* (1968) (294 as *A. setacea*), T. Cope & A. Gray, *Grasses of the British Isles* (94).

Derivation (Clifford & Bostock 2007): in honor of William Curtis (1746–1799) English botanist and entomologist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 10–60 cm long, 2–3 -noded. Culm-internodes scaberulous. Leaf-sheaths without keel, scaberulous. Ligule an eciliate membrane, 2–4 mm long, acute. Leaf-blades filiform, conduplicate, 5–20 cm long, 0.2–0.3 mm wide. Leaf-blade surface scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Peduncle scaberulous above. Panicle contracted, lanceolate, 3–10 cm long, 0.5–1.5 cm wide. Panicle branches terete, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 1–4 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 3–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1–1.3 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.4–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume apex acute.

Florets. Fertile lemma oblong or ovate, 2–2.7 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 4–5 mm long overall, with twisted column. Palea oblong, 0.1–0.25 length of lemma, hyaline, 2 -veined. Palea apex obtuse.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 1.5–2 mm long. Stigmas 2, laterally exerted. Caryopsis with adherent pericarp, ellipsoid, isodiametric, biconvex, estipitate, without sulcus, 1.5 mm long, smooth, apex unappendaged. Embryo 0.2 length of caryopsis. Hilum linear, 0.9 length of caryopsis. Endosperm farinose.

n = 7 (1 ref TROPICOS).

Distribution (TDWG). Continent. Europe, Africa.

Region. Northern Europe, Southwestern Europe.

Country /Province /State. : Great Britain. : France, Portugal, Spain. **Northern Africa.** Morocco.

Agrostis cypricola H. Lindb. *Arsbok Soc. Sci. Fenn.* 20. B. No. 7, 5 (1942).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cyprus. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: IT: *H. Lindberg*, 9 June 1939, Cyprus: Kyrenia, Boghazi (S-G250).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-cola*, dweller. From Cyprus.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Stolons absent. Culms erect, 8–40 cm long, 2–5 -noded. Culm-internodes smooth, distally glabrous. Lateral branches lacking. Leaf-sheaths striately veined, smooth, glabrous on surface. Ligule an eciliate membrane, 4–5 mm long, entire or lacerate, obtuse. Leaf-blades ascending, 15–20 cm long, 2–4 mm wide, glaucous. Leaf-blade surface ribbed, scabrous, rough on both sides. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, linear or lanceolate or oblong, dense, 5 cm long, 1.5–2 cm wide. Primary panicle branches whorled at most nodes, 1–1.5 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, mucronate. Palea oblong, 1 mm long, 0.66 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 1 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Western Asia. Cyprus.

Agrostis decaryana A. Camus. *Bull. Soc. Bot. France*, 78: 35 (1931).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madagascar, Befotoka: Decary 4422.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Raymond Decary (1891–1973) French botanist.

Classification. Subfamily Pooideae. Tribe: Poae.

Habit, Vegetative Morphology. Perennial. Culms geniculately ascending, 80–100 cm long. Culm-internodes distally glabrous. Leaf-sheaths striately veined, smooth, glabrous on surface. Ligule an eciliate membrane, 3 mm long. Leaf-blades 12 cm long, 4 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, loose, 25 cm long, 10–12 cm wide, bearing few spikelets. Primary panicle branches distant, 10 cm long. Panicle branches glabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 3–7 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose. Floret callus hairs 0.15 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 4 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 4 mm long, 1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 2.5–3 mm long, hyaline, without keel, 3 -veined, 0–3 -veined. Lemma surface pilose. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight, 4 mm long overall, without a column. Palea 2 mm long, hyaline.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Agrostis delicatula Pourr. ex Lapeyr. *Hist. Abr. Pyr. Suppl.* :12 (1818).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Spain. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Spain, San Pedro de los Montes: Pourret.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *delicatus*, dainty; *-ula*, diminutive. Small and dainty as of habit.

Classification. Subfamily Pooideae. Tribe: Poae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 20–40 cm long. Ligule an eciliate membrane, acute. Leaf-blades involute, 3–10 cm long, 1–3.5 mm wide, glaucous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 12–20 cm long. Primary panicle branches spreading. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, clavate, 2–3 length of fertile spikelet.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.2 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume lanceolate, 1.2 mm long, 2–3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex obtuse.

Florets. Fertile lemma elliptic, 0.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex lobed, 5 -fid, incised 0.15 of lemma length, truncate, mucous. Palea 0.5 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Europe, Africa.

Region. Southwestern Europe.

Country /Province /State. : Portugal, Spain. **Northern Africa.** Morocco.

Agrostis delislei Hemsl. *Rep. Sci. Results Vey. Challeng. Bot.* 1:II 269 (1884).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Amsterdam Island. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Amsterdam Is.: Moseley.

Illustrations: None found.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 20–30 cm long. Ligule an eciliate membrane, 2–4 mm long, obtuse. Leaf-blades 4–11 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 5–8 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 4–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 4–5 mm long, 1 length of upper glume, membranous, 1-keeled. Lower glume apex acuminate. Upper glume lanceolate, 4–5 mm long, membranous, 1-keeled. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.66 way up back of lemma, curved, 2–3 mm long overall. Palea 0.66 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Antarctica.

Country /Province /State. **Subantarctic islands.** Amsterdam-St Paul Is.

Agrostis densiflora Vasey. *Contrib. U. S. Nat. Herb.* 3: 72 (1892).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006) (& as *A. clivicola*).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *C. L. Anderson, 1886, USA: California, Santa Cruz (US-2479639)*.

Recent Synonyms: *Agrostis californica* Trin. *Agrost.* 2: 113 (1841). *Agrostis toluensis* Kunth, *Nov. Gen. et Sp.* 1: 135. (1816).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (652).

Derivation (Clifford & Bostock 2007): *L. densus*, dense; *flos*, flower. Inflorescences congested.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending, 15–60 cm long. Lateral branches lacking. Leaf-sheaths smooth or scaberulous. Ligule an eciliate membrane, 3–4 mm long,

pubescent on abaxial surface, truncate. Leaf-blades 5–10 cm long, 3–5 mm wide. Leaf-blade surface ribbed, scabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, continuous or interrupted, 2–8 cm long, 0.5–1 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 3 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex acute or acuminate. Upper glume lanceolate, 3 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface scabrous. Upper glume apex acute or acuminate.

Florets. Fertile lemma elliptic, 2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex dentate, 4 -fid, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.66–0.75 way up back of lemma, straight, 0–2 mm long overall. Palea 0.25–0.33 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.75–1.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southwestern USA. California.

Agrostis diemenica D.I.Morris. *Telopea* 10(3): 765 (-767; figs. 1–2) (2004).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia, Tasmania, Second Bar Lake: Moscal 6946 (HO holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. from Tasmania, formerly Van deiman's Land.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms erect, 15–35 cm long. Culm-internodes smooth. Leaf-sheaths loose, ribbed. Ligule an eciliate membrane, 1–3 mm long, entire or erose, obtuse. Leaf-blades 6–12 cm long, 1–2 mm wide. Leaf-blade surface smooth or scaberulous, rough on both sides.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Peduncle smooth or scaberulous above. Panicle open, pyramidal, 5–10 cm long, with spikelets clustered towards branch tips. Primary panicle branches spreading, 2 -nate (upper nodes), whorled at lower nodes. Panicle branches stiff. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, reaching apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 2–3 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.75–2.75 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure or distinct. Lemma apex muticous. Palea absent or minute.

Flower and Fruit. Anthers 3, 0.5–1.6 mm long. Caryopsis with adherent pericarp, 1.25 mm long.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Tasmania.

Agrostis diffusa S.M. Phillips, non Host(1809). *Kew Bull.*, 41(1): 137 (1986).

Accepted by: U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ethiopia.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. widely spreading. Inflorescence an open panicle.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms geniculately ascending, slender, 40–100 cm long. Ligule an eciliate membrane. Leaf-blades 2–4 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic or ovate, effuse, 15–30 cm long, 8–17 cm wide. Primary panicle branches branching divaricately. Panicle branches capillary, flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3.3–4.8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 3.3–4.8 mm long, 1.2 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scaberulous. Lower glume surface smooth or asperulous. Lower glume apex acuminate. Upper glume elliptic or oblong, 2.8–4 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume surface smooth or asperulous. Upper glume apex acute.

Florets. Fertile lemma lanceolate or oblong, 2.6–3.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent (0.3–0.6mm). Lemma surface pilose. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 4.2–6 mm long overall, with twisted column. Palea 0.5–0.75 length of lemma, hyaline, 2 -veined. Rhachilla extension 0.2–2 mm long, pilose.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Ethiopia (inc. Eritrea).

Agrostis divaricatissima Mez. *Fedde, Repert.* 18: 4 (1922).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Korea. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Korea, Upyeng-Yang R.: Faurie 1283 (LE iso).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 458).

Derivation (Clifford & Bostock 2007): L. *divarico*, spread out; *-issima*, most. Panicle, large and diffuse.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50 cm long. Ligule an eciliate membrane. Leaf-blades 8–10 cm long, 2–3.5 mm wide.

Inflorescence. Inflorescence a panicle. Peduncle smooth. Panicle open, ovate, 20 cm long, 10 cm wide. Primary panicle branches spreading. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 2–2.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–2.5 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.2–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex truncate, mucicous. Palea 0.5 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.2 mm long, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Siberia, **China, Mongolia, Eastern Asia.** Altay, Buryatiya, Chita, Irkutsk, Tuva, Mongolia.

Heilongjiang, or Jilin, or Liaoning.

Agrostis dshungarica (Tzvelev) Tzvelev. *Pl. Central Asia* 4: 292 . (2001).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from Russia. **Basionym or Replaced Name:** *Pentatherum dshungaricum* Tzvelev, *Akad. Nauk SSSR Bot. Inst. Komarova, Rast. Tsentral. Azii, Fasc.* 4, 77 (1968). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Venzjtzuan: Kuan 1661 (LE holo).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 458).

Derivation (Clifford & Bostock 2007): *L. -ica*, belonging to. From the Jungaria-Kashgaria mountains, former Soviet Union.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 20–40 cm long. Culm-internodes smooth, distally glabrous. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 1.5–2.5 mm long, scaberulous on abaxial surface. Leaf-blades 5–10 mm wide. Leaf-blade surface scaberulous, rough adaxially, glabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, (5–)10–30 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded. Floret callus hairs 0.33 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3–4 mm long, 1 length of upper glume, membranous, 1-keeled, 1–3 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent or obscure. Lower glume apex acute. Upper glume lanceolate, 3–4 mm long, 1.5–1.6 length of adjacent fertile lemma, membranous, 1-keeled, 1–3 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent or obscure. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface pilose. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.3–0.4 way up back of lemma, straight or geniculate, 3–4.3 mm long overall, without a column or with twisted column. Palea 0.5 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.7–0.9 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Middle Asia, China. Kazakhstan. Xinjiang.

Agrostis durieui Boiss. & Reut. ex Merino. *Fl. Descr. Illustr. Galicia* 3:275, no. 1562 (1909).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Spain. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Spain, Asturias: *Durieui* .

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Michel Charles Durieu de Maisonneuve (1796–1878) French botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 20–40 cm long. Ligule an eciliate membrane, truncate. Leaf-blades flat, 3–10 cm long, 1–3.5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 12–20 cm long. Primary panicle branches spreading. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, clavate, 2–3 length of fertile spikelet.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.7 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume lanceolate, 1.7 mm long, 2–3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex obtuse.

Florets. Fertile lemma elliptic, 0.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex lobed, 5 -fid, incised 0.25 of lemma length, truncate, muticous. Palea 0.5 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear.

$2n = 14$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Europe, Africa.

Region. Southwestern Europe.

Country /Province /State. : France, Portugal, Spain. **Western Indian Ocean.** Madagascar.

Agrostis dyeri Petrie. *Trans. N. Z. Inst.* 22. 1889, 441 (1896).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from New Zealand. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New Zealand, Ruahine Mts.: *Petrie* (WELT lecto).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of William Turner Thiselton-Dyer (1843–1928) English botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Basal innovations intravaginal. Culms erect or geniculately ascending, 15–55 cm long. Leaf-sheaths smooth or antrorsely scabrous. Ligule an eciliate membrane, 0.8–2.2 mm long, glabrous on abaxial surface or scaberulous on abaxial surface, erose or lacerate, truncate. Leaf-blades 3.5–10 cm long, 1–2.5 mm wide. Leaf-blade surface scaberulous, rough adaxially or on both sides. Leaf-blade margins scaberulous. Leaf-blade apex acute or acuminate.

Inflorescence. Inflorescence a panicle. Peduncle smooth. Panicle open, lanceolate, 5–12 cm long. Panicle axis smooth. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, hairy in 2 tufts.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 3–3.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3–3.5 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 2.3–3.3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, truncate, muticous or awned, 1 -awned.

Principal lemma awn dorsal, arising 0.5–0.66 way up back of lemma, straight, 0–2 mm long overall. Palea 0.5–0.8 mm long, 0.25 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.6–1.2 mm long. Caryopsis with adherent pericarp, 1–1.8 mm long. Hilum linear.

Agrostis elliotiana Schult. *Mant.* 2: 372 (1824).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: : Based on *A. arachnoides* Ell. ; USA, Orangeburgh: Bennett (CHARL holo).

Recent Synonyms: *Agrostis exigua* Thurb., *S. Wats. Bot. Calif.* 2: 275. (1880).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (660), F.W.Gould, *The Grasses of Texas* (1975) (144, Fig. 72).

Derivation (Clifford & Bostock 2007): in honor of George Francis Scott Elliott (1861–1934) Indian-born Scottish botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms weak, 2.5–30 cm long. Lateral branches lacking. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 1.5–5 mm long, obtuse. Leaf-blades flat or conduplicate, 2–7 cm long, 1–1.6 mm wide. Leaf-blade surface ribbed.

Inflorescence. Inflorescence a panicle, deciduous as a whole. Panicle open, ovate, effuse, 5–20 cm long. Primary panicle branches 2–5 -nate, whorled at most nodes. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.2–2.2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.2–2 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth or scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.2–2 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth or scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.1–1.8 mm long, hyaline, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins extending close to apex. Lemma apex erose, obtuse, mucicous or awned, 1 -awned. Principal lemma awn subapical, flexuous, 4–8 mm long overall, without a column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Agrostis elliotii Hook. ex S. Elliot. *Journ. Linn. Soc.* 29: 65 (1891).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madagascar, Ankaratra Mts.: Scott-Elliot 2090 ; Madagascar, Ankaratra Mts.: Scott-Elliot 2921 (K syn).

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (113, Fig. 34).

Derivation (Clifford & Bostock 2007): in honor of George Francis Scott Elliott (1861–1934) Indian-born Scottish botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms geniculately ascending, 50–70 cm long. Ligule an eciliate membrane, 2 mm long, truncate. Leaf-blades 10–25 cm long, 3–5 mm wide, stiff. Leaf-blade surface scabrous, rough adaxially. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, interrupted, 5–15 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3.5–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 3.5–4 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acute. Upper glume lanceolate, 3–3.5 mm long, 1.2–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acute.

Florets. Fertile lemma oblong, 2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 3 mm long overall, with twisted column. Palea 0.5 mm long, 0.2 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Agrostis emirnensis (Baker) Bosser. *Adansonia, n. s.*, 8: 516 (1968).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. **Basionym or Replaced Name:** *Deyeuxia emirnensis* Baker, *Journ. Linn. Soc.* 22: 533 (1887). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madagascar: Baron 4497 (K iso).

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (115, Fig. 35).

Derivation (Clifford & Bostock 2007): *L. pensis*, denoting origin. From Emern, Madagascar.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, 60–80 cm long. Ligule an eciliate membrane, 3–4 mm long. Leaf-blades 10–20 cm long, 2–6 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 12–25 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3.5–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded. Floret callus hairs 2.5 mm long, 0.8 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3.5–4 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 3.5–4 mm long, 1.1–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn

subapical, straight, 2.5 mm long overall, without a column. Palea 2.5–3 mm long, 0.75–1 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.8 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Agrostis continuata Stapf. *Kew Bull.* 1897, 290. (1897).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Malawi. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Malawi: Buchanan 356 (K holo).

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (99, Fig. 70, as *A. natalensis*).

Derivation (Clifford & Bostock 2007): *L. continuus*, uninterrupted; *-ata*, possessing. The rhachilla projects conspicuously beyond the floret.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 30–70 cm long, 2–4 -noded. Ligule an eciliate membrane. Leaf-blades 8–25 cm long, 2–3 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 5–20 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 3–5 mm long, 1.1–1.2 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.5–4.5 mm long, 1.2–1.8 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acute.

Florets. Fertile lemma ovate, 2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface glabrous or pilose. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2–0.25 way up back of lemma, geniculate, 2–4 mm long overall, with twisted column. Palea 0.25–0.33 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1–1.5 mm long. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. East Tropical Africa, South Tropical Africa, Southern Africa. Tanzania. Malawi, Zimbabwe. Limpopo, North-West, Mpumalanga, Swaziland, Kwazulu-Natal.

Agrostis eriantha Hack. *Vierteljahrsschr. Naturf. Ges. Zurich.* 49: 172 (1904).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: South Africa, Middleburg: Schlechter 4052 (K isosyn) ; South Africa, Pretoria: Schlechter 4144 (K iso).

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (100, Fig 71), G.E.Gibbs Russell et al, *Grasses of Southern Africa* (1990) (33, Fig 12 var. *eriantha*).

Images: G.E.Gibbs Russell et al, *Grasses of Southern Africa* (1990);, F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): Gk. *erion*, wool; anthos, flower. With wooly glumes, lemmas or awns.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms 30–70 cm long. Ligule an eciliate membrane. Leaf-blades filiform, conduplicate, 9–18 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 15–30 cm long. Primary panicle branches spreading. Panicle branches stiff, straight. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.5–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, reaching apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3.5–5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 3.5–5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 3.5–5 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface pubescent. Lemma apex dentate, 4 -fid, truncate, awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 5–8 mm long overall, with a straight or slightly twisted column. Palea 0.75 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Europe, Africa.

Region. Northern Europe (*).

Country /Province /State. : GB Aliens (Ryves et al). **Southern Africa.** Gauteng, Mpumalanga, Swaziland, Free State, Kwazulu-Natal, Lesotho, Eastern Cape.

Agrostis eriolepis Keng ex Y.C. Yang. *Bull. Bot. Res. North-East. Forest. Inst.*, 4(4): 97 (1984).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Kangding Xian: Liu 1335.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *erion*, wool; *lepis*, scale. With densely hairy glumes, sterile lemmas or palea.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 30–45 cm long, 3–4 -noded. Culm-internodes smooth. Leaves cauline. Leaf-sheaths mostly shorter than adjacent culm internode. Ligule an eciliate membrane, 2.5–3 mm long, lacerate. Leaf-blades 5–10 cm long, 2–3 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 7–15 cm long. Primary panicle branches ascending, 2–7 -nate, whorled at most nodes, 2–5 cm long. Panicle branches puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.4–0.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3–3.5 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein ciliolate. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3–3.5 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein ciliolate. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface pilose, hairy below. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 3–4 mm long overall, with twisted column. Palea 0.7 mm long, 0.33 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.7 mm long. Caryopsis with adherent pericarp, ellipsoid or oblong, 1.2 mm long, dark brown. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. **China.** China South Central.
Sichuan.

Agrostis exasperata Trin. *Mém. Acad. Imp. Sci. Saint-Pétersbourg, Sér. 6, Sci. Math., Seconde Pt. Sci. Nat.* 6,4(3–4): 352 (1841).

TYPE from Chile. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Concepción, *d'Urville s.n* herb. Kunth.

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (109).

Agrostis exarata Trin. *Gram. Unifl.* 205 (1824).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983), T.Koyama, *Grasses of Japan and its neighboring regions* (1987), W.D.Clayton & N.Snow, *Key to Pacific Grasses* (2010).

TYPE from Aleutian Islands. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Aleutian Is., Unalaska: *Eschscholtz* (LE holo).

Recent Synonyms: *Agrostis alaskana* Hulten, *Fl. Aleut. Isl.* 71 (1937). *Agrostis longiligula* Hitchc, *U.S. Dept. Agric. Bull. Pl. Ind.* 68: 54. (1905).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (652).

Derivation (Clifford & Bostock 2007): *L. exaro*, plough up. With furrows between the nerves of the lemmas;

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–90 cm long. Leaf-sheaths smooth or antrorsely scabrous. Ligule an eciliate membrane, 3–6 mm long. Leaf-blades 4–15 cm long, 2–6 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Peduncle antrorsely scabrous above. Panicle contracted, linear, interrupted, 10–18 cm long, 1–3 cm wide. Primary panicle branches appressed or ascending, 1–4 cm long, bearing spikelets almost to the base. Panicle branches stiff, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous or pilose.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2.5–3.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute or acuminate. Upper glume lanceolate, 2.5–3.5 mm long, 1.2–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma oblong, 2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight or geniculate, 5 mm long overall, without a column or with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.6 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). **Continent.** Europe, Temperate Asia, Pacific, North America.

Region. Northern Europe (*).

Country /Province /State. : GB Aliens (Ryves et al). Russian Far East, **Eastern Asia.** Kamchatka, Kuril Is. Japan Hokkaido, or Honshu, or Shikoku, or Kyushu. Agrostis exserta Swallen. *Contrib. U. S. Nat. Herb.* 29: 404 (1950).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Guatemala. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Guatemala, Tojquia: Steyermark 50119 (US holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. exserta*. Rhachilla longer than in related species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, slender, 10–20 cm long, 0-noded. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1.5–2 mm long. Leaf-blades straight, involute, 1–4 cm long, 1–2 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 1–5 cm long, bearing few spikelets. Primary panicle branches ascending, rebranched above middle. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.5–1.6 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, reaching apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1.5–1.6 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 1-veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.5–1.6 mm long, 1 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1-veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5–1.6 mm long, hyaline, without keel, 5-veined, more than 3-veined. Lemma apex erose, obtuse, muticous or awned, 1-awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight, 0–2 mm long overall. Palea 0.75 length of lemma, hyaline. Rhachilla extension 0.33 length of fertile floret.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Guatemala.

Agrostis filipes Hook. f. *Fl. Brit. Ind.* 7: 256. (1896).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Khasia Hills: *Clarke*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. filum*, thread; *pes*, foot. Pedicels of spikelets slender.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 13–35 cm long. Ligule an eciliate membrane, 1–2 mm long, truncate. Leaf-blades 2.5–7.5 cm long, 1–2.5 mm wide. Leaf-blade surface smooth or scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear, interrupted, 5–12 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.2–2.7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.2–2.7 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.4–1.8 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5–0.66 way up back of lemma, geniculate, 1–2 mm long overall, with twisted column. Palea 0.5 mm long, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.5–0.8 mm long. Stigmas 2, laterally exerted. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

$n = 21$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent, Indo-China. Assam, India, Pakistan, West Himalaya.

Sikkim. Meghalaya. West Bengal. Himachal Pradesh.

Agrostis flaccida Hack. *Bull. Herb. Boiss.* 7: 649. (1899).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983), T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

TYPE from Japan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Japan, Hakodate Mt.: *Faurie 1125* .

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. unable to support its own weight. Inflorescence branches long and thin and so droop.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect or geniculately ascending, 15–30 cm long, 1 mm diam., 3 -noded. Leaf-sheaths smooth. Ligule an eciliate membrane, 0.5–2 mm long, scaberulous on abaxial surface. Leaf-blades flat or involute, 3–10 cm long, 0.5–2 mm wide. Leaf-blade surface smooth.

Inflorescence. Inflorescence a panicle. Peduncle smooth. Panicle open, ovate, 4–8 cm long, 3–4 cm wide. Primary panicle branches 2–5 -nate, 2–7 cm long. Panicle branches smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–2 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2.5–3 mm long, 1.2 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–2.5 mm long, membranous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.5–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure, extending close to apex. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.05–0.1 way up back of lemma, geniculate, 3–5 mm long overall, with twisted column. Palea present or absent or minute, 0–0.2 mm long, 0–0.1 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.8–1.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

$2n = 14$, or 28 (4 refs TROPICOS).

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Russian Far East, China, Eastern Asia, Russia. Kamchatka, Kuril Is, Sakhalin. Manchuria. Japan Kyushu. Japan, Korea.

Heilongjiang.

Agrostis foliata Hook. f. *Fl. Antarct.* 95. (1844).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ecuador, Pichincha: Jameson 229 (K holo).

Recent Synonyms: *Agrostis nigritella* Pilger, *Engl. Jahrb.* 25: 713. (1898).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. folium*, leaf; *-ata*, possessing. Panicle with many leafy bracts.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 15–30 cm long. Lateral branches lacking. Leaves mostly basal. Ligule an eciliate membrane, 5–8 mm long. Leaf-blades 3–7 cm long, 2–5 mm wide, coriaceous. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, oblong, continuous or interrupted, 5–10 cm long, 1–1.7 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.2–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 3.2–3.5 mm long, membranous, purple or black, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth or asperulous. Lower glume apex acuminate. Upper glume oblong, 3.2–3.5 mm long, membranous, purple or black, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface smooth or asperulous. Upper glume apex acuminate.

Florets. Fertile lemma ovate, 2 mm long, membranous, without keel. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33 way up back of lemma, geniculate, 2–2.5 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia, Ecuador, Peru.

Accepted by: U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from Taiwan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Taiwan, Mt. Nankotaisan: Ohwi 4147 (K iso).

Illustrations (Books): C-C Hsu, *Flora of Taiwan*, Vol 5 (1978) (244), C-C Hsu, *Taiwan Grasses* (1975) (401, Pl. 1376).

Derivation (Clifford & Bostock 2007): in honor of K. Fukuyama, Japanese botanists.

Classification. Subfamily Pooideae. Tribe: Poeae.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Taiwan.

Agrostis gelida Trin. *Mem. Acad. Petersb. Ser.* 6, 4(3–4): 343. (1841).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Peru. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Peru, Andes de Pasco: Poeppig (LE holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. frost*. Growing at high altitudes.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 35–60 cm long. Ligule an eciliate membrane, 4–5 mm long. Leaf-blades 2–4 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 13–17 cm long. Primary panicle branches ascending, whorled at most nodes. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5–1.7 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy at base. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.4–0.5 way up back of lemma, geniculate, 2 mm long overall, with twisted column. Palea 0.4–0.5 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Agrostis ghiesbreghtii Fourn. *Gram. Mexi*: 97. (1886).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mexico, Oaxaca: Ghiesbreght.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of August Ghiesbreghtii (1810–93) Belgian botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms erect, 50–90 cm long. Culm-internodes smooth, distally glabrous. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 2–4 mm long. Leaf-blades erect, filiform, involute, 1 mm wide. Leaf-blade surface smooth or scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 15–30 cm long. Primary panicle branches whorled at most nodes, branching divaricately, 5–10 cm long. Panicle branches capillary, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Central Mexico, Northeast Mexico, Gulf (Mexico), Southwest Mexico, Southeast Mexico. **Mesoamerica.** Guatemala.

Mexico State, Morelos, Puebla. Hidalgo. Veracruz. Guerrero, Oaxaca. Chiapas.

Agrostis gigantea Roth. *Tent. Fl. Germ.* 1: 31 (1788).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000) (& as *A. moldavica*), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983), T.Koyama, *Grasses of Japan and its neighboring regions* (1987) (*A. nigra*, *A. alba*).

TYPE from Germany. **Basionym or Replaced Name:** *Agrostis nigra* With. *Arr. Brit. Pl.* ed. 3(2) 131 (1796). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Germany, Bremen: Roth.

Recent Synonyms: *Agrostis diffusa* Banks & Sol. ex Hook.f., in syn, non Host (1809), *Fl. Nov.-Zel.* 1:298 (1853).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (109), C.E.Hubbard, *Grasses* (1968) (302), T. Cope & A. Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): L. very large. Culms tall compared with those of related species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms geniculately ascending or decumbent, 40–120 cm long, 3–6 -noded, rooting from lower nodes. Culm-internodes smooth. Leaf-sheaths without keel, smooth or scaberulous. Ligule an eciliate membrane, 1.5–6 mm long, truncate. Leaf-blades 5–20 cm long, 2–8 mm wide. Leaf-blade surface ribbed, scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, oblong to ovate, effuse, 8–25 cm long, 3–15 cm wide. Primary panicle branches whorled at most nodes. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 0.5–3 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 2–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1–1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.3–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.3–2.3 mm long, hyaline, without keel, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma apex truncate. Palea oblong, 0.5–0.7 length of lemma, hyaline, 2 -veined. Palea apex obtuse.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 1–1.5 mm long. Stigmas 2, laterally exserted. Caryopsis with adherent pericarp, ellipsoid, isodiametric, biconvex, estipitate, without sulcus, smooth, apex unappendaged. Embryo 0.2 length of caryopsis. Hilum linear, 0.9 length of caryopsis. Endosperm farinose.

$n = 21$ (3 refs TROPICOS). $2n = 28$, or 42 (6 refs TROPICOS).

Distribution (TDWG). **Continent.** Europe, Africa, Temperate Asia, Tropical Asia, Australasia (*), North America, South America, Antarctica.

Region. Northern Europe, Middle Europe, Southwestern Europe, Southeastern Europe, Eastern Europe.

Agrostis glabra (HBK) Spreng. *Syst.* 1: 262 (1825).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. **Basionym or Replaced Name:** *Trichodium glabrum* Presl, *Rel. Haenk.* 1: 244 (1830). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Chile: Haenke.

Recent Synonyms: *Agrostis pyrogea* Speg., *Anal. Mus. Buenos Aires*, 5: 83 (1896).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (110), E.G.Nicora, *Los Generos de Gramineas de America Austral* (1987) (174, Fig. 45 as *A. pyrogea*), M.N.Correa, *Flora Patagonica* Parte III, Gramineae (1978) (382, Fig. 254 as *Agrostis glabra* var. *melanthes* & *A. pyrogea*).

Derivation (Clifford & Bostock 2007): L. smooth. Leaf-blades lacking hairs.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, culms solitary. Rhizomes short or elongated. Culms erect, 25–70 cm long, 2–4 -noded. Culm-nodes brown. Leaves cauline. Leaf-sheaths 2.5–20 cm long, smooth or scaberulous. Ligule an eciliate membrane, 3–10 mm long, scaberulous on abaxial surface, erose. Leaf-blades 2.5–15 cm long, 1.5–5 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, nodding, 8–28 cm long. Primary panicle branches 2–5 -nate. Panicle axis 5–7 noded. Panicle branches flexuous, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous, puberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.6–3.1 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose. Floret callus hairs 0.33–0.5 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.6–3.1 mm long, 1.5–1.6 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.6–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, muticous or mucronate. Principal lemma awn dorsal. Palea absent or minute.

Flower and Fruit. Lodicules 2, 0.4–0.5 mm long, membranous. Anthers 3, 1.2–1.8 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina South, Chile Central, Chile South.

Mendoza, San Juan. Chubut, Neuquén, Río Negro, Santa Cruz, Tierra del Fuego. Rest of Chile- Biobio, La Auracania, Maule, O'Higgins, Santado, Valpariso, Chiloe, Aisen, Magellanes. Coquimbo, Santiago, O'Higgins, Maule, Biobio, La Araucania. Los Lagos, Aisen, Magellanes.

Agrostis goughensis C.E.Hubb. *Bull. Brit. Mus. (Nat. Hist.), Bot.*, 8(4): 379 (1981).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Gough Island. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Gough Is.: Wade 49 (BM holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Gough Island in the South Atlantic.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, mat forming. Stolons present. Culms decumbent, 40–80 cm long, 3–7 -noded, rooting from lower nodes. Culm-internodes terete, smooth, distally glabrous. Leaf-sheaths mostly shorter than adjacent culm internode, smooth, glabrous on surface. Ligule an eciliate membrane, 5–10 mm long, obtuse. Leaf-blades 1–10 cm long, 3–6 mm wide. Leaf-blade surface ribbed, grooved adaxially, scaberulous, rough adaxially. Leaf-blade margins scaberulous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 10–23 cm long, 1–3 cm wide, contracted about primary branches. Primary panicle branches spreading, 2–5 cm long, bearing spikelets almost to the base. Panicle axis scabrous. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 1–4 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 4–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.2–0.5 mm long.

Glumes. Glumes persistent, similar, with lower wider than upper, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 4–4.5 mm long, 1–1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 4–4.5 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong or ovate, 2–2.3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.66 way up back of lemma, straight, 1–2.5 mm long overall. Palea oblong, 1 mm long, 0.25 length of lemma, hyaline, 2 -veined. Palea apex obtuse.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.8–1 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Antarctica.

Country /Province /State. Subantarctic islands. Tristan de Cunha.

Agrostis gracilifolia C. E. Hubbard. *Kew Bull.* 1936, 307. (1936).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uganda. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Uganda, Mt. Elgon: *Liebenberg 1689* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. gracilis*, slender; *folium*, leaf. Leaf blades less than 0.5 mm broad.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 5–60 cm long. Ligule an eciliate membrane. Leaf-blades filiform or aciculate, involute, 2–2.5 cm long, 1 mm wide, stiff. Leaf-blade venation without layer of subepidermal sclerenchyma masking vein striation or with continuous uniform subepidermal sclerenchyma layer on the underside. Leaf-blade surface smooth.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 2–20 cm long. Primary panicle branches spreading. Panicle branches stiff, smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, smooth or scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 2–4 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scaberulous. Lower glume surface smooth. Lower glume apex acute. Upper glume lanceolate, 2–4 mm long, 1–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume surface smooth. Upper glume apex acute.

Florets. Fertile lemma ovate, 2–3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface glabrous or pubescent. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 3–5 mm long overall, with twisted column. Palea 1 length of lemma, hyaline, 2 -veined. Rhachilla extension 0.1–0.2 length of fertile floret, pilose.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa. DRC. Ethiopia (inc. Eritrea). Kenya, Uganda.

Agrostis gracililaxa J.A. Franco. *Bot. J. Linn. Soc.*, 76(4): 336 (1978).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Azores. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Azores, Flores, Racha do bordoes: Goncalves 1373 (LISI holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. gracilis*, slender; *laxa*, loose. Culms subcapillary, flexuose.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending, 10–20 cm long. Ligule an eciliate membrane, 0.5–1.5 mm long. Leaf-blades flat or involute, 1–10 cm long, 0.5–4 mm wide. Leaf-blade surface scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 1.5–4.5 cm long. Primary panicle branches spreading (at anthesis). Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 1 length of fertile spikelet, smooth.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 2–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous or sparsely hairy. Floret callus hairs 0–0.3 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth or scaberulous. Lower glume lateral veins absent. Lower glume apex acute, mucicous or mucronate. Upper glume lanceolate, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute, mucicous or mucronate.

Florets. Fertile lemma elliptic to oblong, 1.3–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins prominent, excurrent or extending close to apex. Lemma surface smooth or scaberulous, glabrous or pubescent. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn dorsal,

arising 0.1–0.2 way up back of lemma, geniculate, 2–4 mm long overall, with twisted column. Palea 0.6–0.8 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 1–1.2 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Europe, Africa.

Region. Southwestern Europe.

Country /Province /State. Macaronesia. Azores.

Agrostis griffithiana (Hook. f.) Bor. *Grasses Burma, Ceyl., Ind. & Pakist.* 387 (1960).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. **Basionym or Replaced Name:** *Calamagrostis griffithiana* Hook. f., *Fl. Brit. Ind.* 7: 263 (1896). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Khasia Hills: Griffith 6598 (K syn) ; India, Kumaon: Strachey & Winterbottom (K syn).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating connection. In honor of William Griffith (1810–1845), English-born surgeon-botanist in India and southeast Asia.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–100 cm long. Ligule an eciliate membrane, 2–3 mm long, scaberulous on abaxial surface, truncate. Leaf-blades 15–25 cm long, 3–4 mm wide, coriaceous. Leaf-blade surface smooth.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 6–20 cm long. Primary panicle branches appressed, 2–5 -nate, 5–10 cm long. Panicle branches capillary, smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3–4 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3–4 mm long, 1.3–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 2–3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface pubescent. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1–0.5 way up back of lemma, geniculate, 5–6 mm long overall, clearly exerted from spikelet, with twisted column. Palea 1 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.25 mm long. Caryopsis with adherent pericarp.

n = 14 (2 refs TROPICOS).

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. Assam, India, West Himalaya. Meghalaya, Nagaland. Uttah Pradesh. Himachal Pradesh.

Agrostis hallii Vasey. *Contrib. U. S. Nat. Herb* 3: 74 (1892).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: USA, Oregon: Hall (US holotype).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (653).

Derivation (Clifford & Bostock 2007): in honor of Elihu Hall (1822–82) United States farmer and amateur botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms 40–100 cm long. Lateral branches lacking. Leaf-sheaths smooth. Ligule an eciliate membrane, 2–6 mm long, lacerate, acute. Leaf-blades 3–4 mm wide. Leaf-blade surface scaberulous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or ovate, 7–18 cm long. Primary panicle branches ascending or spreading, whorled at most nodes. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.2–4.2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose. Floret callus hairs 1–2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 3.2–4.2 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3–4 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins prominent, extending close to apex. Lemma apex entire or dentate, 4 -fid, truncate, muticous. Palea absent or minute.

Flower and Fruit. Lodicules 2, 0.5 mm long, membranous. Anthers 3, 1.6–1.8 mm long, purple. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA, Southwestern USA. Oregon. California.

Agrostis hendersonii Hitchcock. *Journ. Wash. Acad. Sc.* 20: 381. (1930).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: USA, Oregon, Gold Hill: *Henderson 12387*.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (659).

Derivation (Clifford & Bostock 2007): in honor of Louis Fourniquet Henderson (1853–1942) United States botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 11 cm long, 2 -noded. Lateral branches lacking. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 2–3 mm long, acute. Leaf-blades flat or convolute, 1–3 cm long, 1 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, 2.5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 5–6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 5–6 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute, awned, 1 -awned, awn 1–2 mm long. Upper glume lanceolate, 5–6 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma elliptic, 3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn dorsal, arising 0.33–0.5 way up back of lemma, geniculate, 6–10 mm long overall. Lateral lemma awns present, arising on apex of lobes, 0.5 mm long. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.75–1.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA, Southwestern USA. Oregon. California.

Agrostis hesperica A.T. Romero Garcia G. Blanca Lopez & C. Moral. *An. Jard. Bot. Madrid*, 43(1): 52 (1986).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Spain. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Spain, Orense: *Romero Garcia & Blanca GDA20926* (GDA holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Hesperis, that is of the west. In this instance, from Spain and Portugal.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely or moderately. Rhizomes short. Stolons present. Basal innovations intravaginal. Culms erect or geniculately ascending, 30–60 cm long, 3–4 -noded. Leaf-sheaths smooth. Ligule an eciliate membrane, 2.5–3 mm long, 1–2.2 mm long on basal shoots, acute. Leaf-blades conduplicate, 3.3–7 cm long, 1–3 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, ovate or pyramidal, 6–15 cm long, 2–5 cm wide. Primary panicle branches 5–6 -nate, whorled at lower nodes. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1 length of fertile spikelet, scabrous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 1.9–2.3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.2–0.3 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.9–2.3 mm long, 1.2–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.4–1.9 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface scaberulous. Lemma apex truncate or acute, muticous or awned (rarely), 1 -awned. Principal lemma awn dorsal, geniculate, 2 mm long overall, with twisted column. Palea oblong, 0.05–0.35 mm long, 0.04–0.2 length of lemma, hyaline, 2 -veined. Palea apex dentate, 2 -fid.

Flower and Fruit. Lodicules 2, lanceolate, 0.35–0.5 mm long, membranous. Anthers 3, 1–1.6 mm long. Stigmas 2, laterally exerted. Caryopsis with adherent pericarp, 1.2 mm long, apex unappendaged. Hilum linear. Endosperm farinose.

$2n = 28$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Europe.

Region. Southwestern Europe.

Country /Province /State. : Spain.

Agrostis hideoi Ohwi. *Bot. Mag., Tokyo*, 44: 568. (1930).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

TYPE from Japan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Japan, Sasagamine: *Ohwi* .

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Hideo Koidzumi (1886–1945) Japanese botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect, 20–40 cm long, 0.5–0.8 mm diam., 4–5 -noded. Leaf-sheaths smooth. Ligule an eciliate membrane, 0.8–1 mm long, truncate or obtuse. Leaf-blades 3–10 cm long, 1–2 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 5–8 cm long, 2–3 cm wide, with spikelets clustered towards branch tips. Primary panicle branches 4–7 -nate, 1–3 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 3–8 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.2 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 3–3.5 mm long, 1.1–1.2 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 2.7–3 mm long, 1.7–1.8 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.5–1.7 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface scaberulous, rough above. Lemma apex dentate, 4 -fid, awned, 5 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 3–3.5 mm long overall, with twisted column. Lateral lemma awns present, arising on apex of lobes, 0.8–1 mm long, shorter than principal. Palea 0.2 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.8–1 mm long. Caryopsis with adherent pericarp, oblong, 1.25 mm long. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Japan Honshu. Japan.

Agrostis himalayana Bor. *Kew Bull.* 1953, 269 (1953).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Assam, Nyukmadung: *Kingdon-Ward 11538* (BM holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating location. From the Himalayas.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms 15–30 cm long, with 0.33–0.5 of their length below uppermost node. Culm-nodes glabrous. Leaf-sheaths antrorsely scabrous. Ligule an eciliate membrane, 3–4 mm long, white or brown, scaberulous on abaxial surface, obtuse or acute. Leaf-blades 5–15 cm long, 2–5 mm wide, flaccid. Leaf-blade surface scaberulous, rough abaxially. Leaf-blade margins scaberulous. Leaf-blade apex acute or acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 4–8.5 cm long, 2–3 cm wide. Primary panicle branches ascending, 1–2 -nate. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, smooth or scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or elliptic, laterally compressed, 1–1.2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, reaching apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume elliptic, 1–1.2 mm long, 1 length of upper glume, membranous, mid-green or purple, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume elliptic, 1–1.2 mm long, 1 length of adjacent fertile lemma, membranous, mid-green or purple, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, muticous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.4 mm long, purple. Caryopsis with adherent pericarp. Hilum linear.

$n = 14$ (2 refs TROPICOS).

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. Assam, Eastern Himalaya. Sikkim. Assam.

Agrostis hirta J.F. Veldkamp. *Blumea* 28(1): 212 (1982).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, J.F.Veldkamp, *Poaceae ms (Flora Malesiana)*.

TYPE from New Guinea. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New Guinea, Sugarloaf: *Hoogland & Schodde 7046* (L holo, LAE, NSW, CANB).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. hairy. Hairy in part or extensively.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Basal innovations intravaginal. Culms erect, 60–120 cm long. Leaf-sheaths smooth. Ligule an eciliate membrane, 7.5 mm long, erose, obtuse. Leaf-blades flat or involute, 15–30 cm long, 2–3 mm wide, flaccid. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Peduncle antrorsely scabrous above. Panicle open, elliptic, effuse, 30 cm long, 8 cm wide. Primary panicle branches 6–12.5 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension or with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 4.3–4.8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.35–0.5 mm long, 0.1–0.2 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 4.3–4.8 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 4.3–4.8 mm long, 1.6 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 2.65–2.85 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma surface pubescent. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.4–0.5 way up back of lemma, geniculate, 5.5–6.5 mm long overall, with twisted column. Column of lemma awn 1.6–3.25 mm long. Palea 1.25 mm long, 0.4–0.5 length of lemma, hyaline, 2 -veined. Rhachilla extension 0–0.25 mm long, glabrous.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.75–0.9 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Papuasiasia. New Guinea PNG. New Guinea.

Agrostis holgateana C.E.Hubb. *Bull. Brit. Mus. (Nat. Hist.), Bot.*, 8(4): 381 (1981).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Tristan da Cunha. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Tristan da Cunha: Wace T.235 (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Martin Wyatt Holdgate (1931-) British biologist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations intravaginal. Culms erect, 9–24 cm long. Culm-internodes terete, smooth, distally glabrous. Leaf-sheaths longer than adjacent culm internode, smooth, glabrous on surface. Ligule an eciliate membrane, 1–2.5 mm long, truncate or obtuse. Leaf-blades erect, straight or curved, filiform, involute, 3–6 cm long, 0.4–0.6 mm

wide, stiff. Leaf-blade surface ribbed, grooved adaxially, scaberulous, rough adaxially. Leaf-blade margins scaberulous. Leaf-blade apex obtuse or abruptly acute.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 1.5–3.5 cm long, 0.2–0.4 cm wide. Primary panicle branches appressed, 2–3 -nate, 0.7–1.5 cm long. Panicle axis smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 0.5–2.5 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 4–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, with lower wider than upper, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 4–5 mm long, 1.3–1.4 length of upper glume, cartilaginous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex acute. Upper glume lanceolate, 3.5 mm long, chartaceous, 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume surface scabrous. Upper glume apex acute.

Florets. Fertile lemma elliptic or ovate, 1.6–1.7 mm long, hyaline, without keel, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma apex entire or dentate, 2 -fid, truncate, mucronate. Principal lemma awn 0.4–0.8 mm long overall. Palea oblong, 0.66 length of lemma, hyaline, 2 -veined. Palea apex emarginate or truncate.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp, lanceolate or oblong, 1–1.2 mm long.

Distribution (TDWG). Continent. Antarctica.

Country /Province /State. Subantarctic islands. Tristan de Cunha.

Agrostis hookeriana C. B. Clarke ex Hook. f. *Fl. Brit. Ind.* 7: 256. (1896).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Sikkim: *Hooker* .

Recent Synonyms: *Agrostis perlaxa* Pilger, Fedde, *Repert. Beih.* 12: 306 (1922).

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (605, Fig. 26), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 470).

Derivation (Clifford & Bostock 2007): L. -ana, indicating connection. As for *hookeri*, usually in honor of Joseph Dalton Hooker (1817–1911), English botanist, traveller and Garden's Director.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms 25–50 cm long. Culm-nodes glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 3.5–4 mm long, acute. Leaf-blades 7–15 cm long, 1–2.25 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 9–18 cm long. Primary panicle branches spreading, 2 -nate, 3–6 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.5–2.5 mm long, 0.5–0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3–3.5 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 1.5–2 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 3.5 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.5–0.75 mm long. Caryopsis with adherent pericarp. Hilum linear.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (653).

Derivation (Clifford & Bostock 2007): in honor of Thomas Jefferson Howell (1842–1912) United States botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–60 cm long. Lateral branches lacking. Leaf-sheaths scaberulous. Ligule an eciliate membrane, 2–3.5 mm long, erose or lacerate, obtuse or acute. Leaf-blades 15–25 cm long, 3–5 mm wide, flaccid.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 10–20 cm long, with spikelets clustered towards branch tips. Primary panicle branches spreading. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 3.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 3.5 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, 2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1–0.2 way up back of lemma, geniculate, 6–7 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, 0.4 mm long, membranous. Anthers 3, 1–2 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA. Oregon, Washington.

Agrostis hugoniana Rendle. *Journ. Linn. Soc.* 6: 389. (1904).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Mt. Kiaowansan: Hugh (BM holo).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 463).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Hugh (fl. 1898) cleric and botanical collector in China.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Culms 7–12 cm long, 2 -noded. Culm-internodes elliptical in section. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1.5–2 mm long, truncate or obtuse. Leaf-blades 5–12 cm long, 2–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear or oblong, dense, 3–7 cm long, 1.2 cm wide. Primary panicle branches appressed, 3 -nate. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3.5 mm long, 1.1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 3 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma apex mucicous. Palea 0.5 mm long, 0.25–0.33 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, China North-Central, Qinghai, Gansu, Shaanxi, Sichuan, Yunnan.

Agrostis humbertii A. Camus. *Bull. Soc. Bot. France*, 106 : 339 (1960).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madagascar, Andohahela: Humbert 13546.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): In honor of Jean Henri Humbert (1887–1967) French botanist who collected in Madagascar.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, slender, 50–60 cm long. Culm-internodes smooth, distally glabrous. Culm-nodes black. Ligule an eciliate membrane. Leaf-blades 6–12 cm long, 3–4 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 14–22 cm long, 2–3 cm wide. Primary panicle branches 6–7 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, ciliate.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose. Floret callus hairs 0.4–0.6 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 4.5 mm long, 1.2 length of upper glume, membranous, 1-keeled, 1–3 -veined. Lower glume lateral veins absent or obscure. Lower glume apex acuminate. Upper glume lanceolate, 3.5–4 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1–3 -veined. Upper glume lateral veins absent or obscure. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 2.5–3 mm long, hyaline, without keel. Lemma surface puberulous. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25–0.33 way up back of lemma, geniculate, 5–6 mm long overall, with twisted column. Palea 2 mm long, hyaline.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Agrostis hyemalis (Walt.) BrittonStern.etPoggenb. *Prelim. Catal.* 68. (1888).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983) (as *A. geminata*).

TYPE from USA. **Basionym or Replaced Name:** *Cornucopiae hyemale* Walt., *Fl. Carol.* 73 (1788). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: USA, South Carolina: Coll?.

Illustrations (Books): T. Cope & A. Gray, *Grasses of the British Isles* (93), M.E.Barkworth et al, *Flora of North America north of Mexico Vol 24 Poaceae*, part 1 (2007) (649).

Derivation (Clifford & Bostock 2007): *L. hiems*, winter; *-alis*, pertaining to. Winter flowering.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 15–70 cm long. Ligule an eciliate membrane, 1.5–4 mm long. Leaf-blades 0.5–3 mm wide.

Inflorescence. Inflorescence a panicle, deciduous as a whole. Panicle open, ovate, effuse, 7–30 cm long, with spikelets clustered towards branch tips. Primary panicle branches spreading, rebranched above middle, 5–15 cm long. Panicle branches capillary, flexuous, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.5–2.1 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.5–2.1 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute or

acuminate. Upper glume lanceolate, 1.5–2.1 mm long, 1.3–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma oblong, 2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex mucous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Europe, Temperate Asia, North America, South America.

Region. Northern Europe, Southwestern Europe.

Country /Province /State. : Great Britain. : Spain. Russian Far East, **Eastern Asia.** Kamchatka. Agrostis hygrometrica Nees. *Mart. Fl. Bras.* 2: 404 (1829).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online (as *Bromidium hygrometricum*), W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil, Rio Jacuhy: Sellow (B holo, BAA, LE).

Recent Synonyms: *Agrostis ramboi* L. Parodi, *Bol. Soc. Argent. Bot.* 1:119 (1946).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (160, as *Bromidium*), L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (476, Fig. 102, 483, Fig. 104 & 493, Fig. 105 as var. *tandilensis*), E.G.Nicora, *Los Generos de Gramineas de America Austral* (1987) (160, Fig. 40 as *Bromidium*), A.Burkat, *Flora Ilustrada de Entre Rios (Argentina)*, Pt II, *Gramineas* (1969) (125, Fig. 40), B.Rosengurt, *Gramineas Uruguayas I* (1970) (22, Fig. 3).

Derivation (Clifford & Bostock 2007): Gk. *hygros*, water; *metron*, measure; -ike, belonging to. Aquatic or swamp species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect, 10–60 cm long. Ligule an eciliate membrane, 1–6 mm long. Leaf-blades 2–3 mm wide.

Inflorescence. Inflorescence a panicle or a panicle with branches tipped by a raceme. Panicle open, lanceolate, interrupted, 5–20 cm long, 1–3 cm wide, contracted about primary branches. Primary panicle branches appressed or ascending, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 0.8–0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.5–4 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2–2.3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 4 -fid, truncate, awned, 3 -awned. Principal lemma awn dorsal, arising 0.33 way up back of lemma, geniculate, 4–6 mm long overall, with twisted column. Lateral lemma awns present, arising on apex of lobes (outer lobes), 0.8 mm long. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.5–0.7 mm long. Caryopsis with adherent pericarp, oblong, 1.5 mm long, dark brown. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil South. Argentina Northeast. Sao Paulo Parana, Catarina, Rio Grande do Sul. Rio Grande do Sul, Santa Catarina. Buenos Aires, Corrientes, Entre Rios, Santa Fe.

Agrostis idahoensis Nash. *Bull. Torr. Bot. Club.* 1897, 42. (1897).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: USA, Idaho, Forest: Heller & Heller 3431 (NY holo, BAA, K, MO, US).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (111), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (650).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Idaho, USA.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 10–30 cm long. Lateral branches lacking. Leaves mostly basal. Ligule an eciliate membrane, 1–2 mm long, erose or lacerate, obtuse or acute. Leaf-blades flat or conduplicate, 0.5–1.5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 5–10 cm long. Primary panicle branches ascending. Panicle branches capillary, flexuous, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.6–2.4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 1.6–2.4 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.6–2.4 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex mucous. Palea present or absent or minute, 0–0.2 mm long, 0.1–0.2 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.2–0.3 mm long, membranous. Anthers 3, 0.3 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Northwest USA, Southwestern USA, South-central USA. Colorado, Oregon, Washington. Arizona, California, Nevada, Utah. New Mexico. **Southern South America.** Chile Central, Chile South.

Chubut. Maule, Biobio. Los Lagos, Magellanes.

Agrostis imbecilla Zotov. *Trans. & Proc. Roy. Soc. N. Z.* 73: 233 (1943).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from New Zealand. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New Zealand, Macraes: *Petrie* (WELT holo).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (112).

Derivation (Clifford & Bostock 2007): L. feeble. Habit creeping or inflorescence slender.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Basal innovations extravaginal. Culms erect or geniculately ascending, 15–35 cm long. Ligule an eciliate membrane, 0.8–1.6 mm long, glabrous on abaxial surface, entire or erose, obtuse. Leaf-blades filiform, involute, 2–13 cm long, 0.2–0.4 mm wide, flaccid. Leaf-blade surface ribbed, scabrous, rough adaxially. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence a panicle. Peduncle smooth. Panicle spiciform, linear, 5–9 cm long, 0.2–0.3 cm wide. Primary panicle branches appressed. Panicle axis scaberulous. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 1.5–2.4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, reaching apex of florets or exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 1.5–2.4 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.5–2.4 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.5–1.9 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure, extending close to apex. Lemma apex erose, truncate, mucicous or awned, 1 -awned. Principal lemma awn subapical, straight, 0–1 mm long overall, not or scarcely exerted from spikelet. Palea 0.1–0.2 mm long, 0.05–0.1 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.2–0.4 mm long, membranous. Anthers 3, 0.6–1 mm long. Caryopsis with adherent pericarp, 1–1.4 mm long. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand North I, New Zealand South I.

Agrostis imberbis R. Phil. *Anal. Univ. Chil.* 94: 11. (1896).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Chile, Chillan: Philippi (SGO holo, BAA).

Illustrations (Books): M.N.Correa, *Flora Patagonica* Parte III, Gramineae (1978) (382, Fig. 255).

Derivation (Clifford & Bostock 2007): L. beardless. Glumes and/or lemmas glabrous.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes elongated. Butt sheaths yellow. Culms geniculately ascending, 30–65 cm long. Leaf-sheaths 3–11 cm long, antrorsely scabrous. Ligule an eciliate membrane, 5–8 mm long, scaberulous on abaxial surface, entire or lacerate, acute. Leaf-blades filiform, conduplicate or convolute, 3–11 cm long, 0.5–1 mm wide, stiff, mid-green. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 8–15 cm long, contracted about primary branches. Primary panicle branches whorled at most nodes. Panicle axis smooth. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous, puberulous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.8–3.1 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous or sparsely hairy.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.8–3.1 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2.1–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface scaberulous, rough above or on veins. Lemma apex truncate, mucicous or mucronate. Principal lemma awn dorsal. Palea absent or minute.

Flower and Fruit. Lodicules 2, 0.4 mm long, membranous. Anthers 3, 1.2–1.8 mm long. Caryopsis with adherent pericarp, ovoid, 1.5–1.6 mm long. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Southern South America. Bolivia, Peru. Argentina South, Chile Central, Chile South.

Mendoza, San Luis. Cordoba, Corrientes. Chubut, Neuquén, Río Negro, Santa Cruz. Rest of Chile-Biobio, La Auracania, Maule, O'Higgins, Santado, Valpariso. Coquimbo, Santiago, O'Higgins, Maule, Biobio. Los Lagos, Magellanes.

Agrostis inaequiglumis Griseb. *Goett. Nachr.* 80. (1868).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Sikkim: *Hooker 10*.

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (601, Fig. 25).

Derivation (Clifford & Bostock 2007): *L. inaequalis*, unequal; gluma, husk. Glumes differing in length and/or shape.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose, clumped densely. Culms erect, 4–5 cm long. Ligule an eciliate membrane, 1 mm long, erose. Leaf-blades convolute, 2–3 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 2.5–4 cm long. Primary panicle branches not whorled or whorled at most nodes. Panicle branches capillary, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 1–1.5 mm long, smooth.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Spikelet callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.5 mm long, 1.7 length of adjacent fertile lemma, membranous, 1-keeled, 1(–3) -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent or obscure. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex mucicous. Palea absent or minute. Rhachilla extension glabrous.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.4 mm long. Caryopsis with adherent pericarp, 1 mm long.

$n = 14$ (2 refs TROPICOS).

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central. **Indian Subcontinent.** Assam, Eastern Himalaya, India.

Yunnan. Bhutan, Sikkim. West Bengal.

Agrostis inconspicua Kunze. *Mem. Acad. Peterb. ser.6, Sci. Math.* pt 2 41:331 (1845).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Chile, Antuco: Poeppig 22 (P lecto).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina 3 – 2 Pooideae* (2012) (112), M.N.Correa, *Flora Patagonica Parte III, Gramineae* (1978) (377, Fig. 253).

Derivation (Clifford & Bostock 2007): *L. inconspicuous*.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms slender, 16–30 cm long. Ligule an eciliate membrane, 1.5–3 mm long, truncate. Leaf-blades 1–1.5 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 3–15 cm long. Primary panicle branches spreading, 2–3 -nate, branching divaricately. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 4–15 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus sparsely hairy.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–3 mm long, 1.1–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.8–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, mucicous or mucronate or awned, 1 -awned. Principal lemma awn dorsal, arising 0.75 way up back of lemma, straight, 0–1 mm long overall. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.7 mm long. Caryopsis with adherent pericarp, 1.6 mm long. Hilum linear.

Distribution (TDWG). Continent. South America.

Derivation (Clifford & Bostock 2007): *L. lax*, weak. Culms decumbent.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes absent or short. Basal innovations extravaginal or intravaginal. Culms erect or geniculately ascending, 40–85 cm long, rooting from lower nodes. Leaf-sheaths smooth. Ligule an eciliate membrane, 4–7 mm long, erose, truncate or obtuse or acute. Leaf-blades flat or involute, 10–25 cm long, 3–6.5 mm wide. Leaf-blade surface smooth or scabrous.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, lanceolate or elliptic, 15–30 cm long. Primary panicle branches 2–11 cm long. Panicle branches smooth or scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 1.5–4.1 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.1–0.3 mm long, 0.1 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.5–4.1 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 1.4–4 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 1.2–3.25 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, truncate or obtuse or acute, mucicous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.3–0.8 way up back of lemma, geniculate, 2–4 mm long overall, with twisted column. Palea 0.1–2 mm long, 0.1–0.75 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.55–1.4 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. **China, Eastern Asia.** China South Central, Manchuria, China North-Central, China Southeast. Taiwan. **Malesia, Papuaasia.** Borneo, Java, Sumatra. New Guinea PNG, or West Papua (Irian Jaya). New Guinea.

Shandong. Hunan. Yunnan.

Agrostis insularis Rugolo & Molina. *Gayana Bot.* 54:111 (1997).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Chile, Isla Alao: Villagran & Mesa 5890 (CONC holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. insula*, island; -are, pertaining to. Island species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Basal innovations extravaginal. Culms erect or geniculately ascending, 28–50 cm long, 2–4 -noded. Culm-internodes distally glabrous. Lateral branches lacking. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 5.5–8.5 mm long, scaberulous on abaxial surface, erose or lacerate, acute. Leaf-blades conduplicate, 2–25 cm long, 2–4 mm wide. Leaf-blade surface scaberulous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle open, oblong, 11–13 cm long, 3–4 cm wide. Primary panicle branches ascending. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–2.5 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.6–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, hairy on the margins. Floret callus hairs 2–2.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.6–3 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5–1.7 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, mucicous. Palea 0.3 mm long, 0.2–0.25 length of lemma, 0 -veined.

Flower and Fruit. Lodicules 2, 0.5–0.6 mm long, membranous. Anthers 3, 0.6–0.9 mm long. Caryopsis with adherent pericarp. Endosperm farinose.

Distribution (TDWG). Continent. South America.

Country /Province /State. **Southern South America.** Chile South.

Los Lagos.

Agrostis isopholis C. E. Hubbard. *Kew Bull.* 1936:303 (1936).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Zaire. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Zaire, Mt. Karisimbi: *Burt 3090* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *Gk. isos*, equal; *pholis*, scale of a snake. Glumes equal or subequal.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms geniculately ascending, 30–45 cm long, 3–4 -noded, with 0.3–0.4 of their length below uppermost node. Culm-nodes glabrous. Lateral branches lacking or

spare. Leaf-sheaths smooth. Ligule an eciliate membrane, 2–3 mm long, obtuse. Leaf-blades flat or involute, 5–10 cm long, 1–1.5 mm wide. Leaf-blade surface smooth or scaberulous, rough adaxially. Leaf-blade margins scaberulous. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 7–17 cm long. Primary panicle branches 3–5 cm long. Panicle branches capillary, flexuous, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–4 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic or oblong, laterally compressed, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2.5–3 mm long, 1 length of upper glume, membranous, glandular (minutely on veins), 1-keeled, 3 -veined. Lower glume primary vein scaberulous. Lower glume apex acute. Upper glume lanceolate, 2.5–3 mm long, 1 length of adjacent fertile lemma, membranous, glandular (minutely on veins), 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume apex acute.

Florets. Fertile lemma oblong or ovate, 2.5–3 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface asperulous, pilose, hairy below. Lemma apex truncate, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.5–0.6 way up back of lemma, straight, 1–2.5 mm long overall. Palea 1.5 mm long, 0.5–0.6 length of lemma, hyaline, 2 -veined. Rhachilla extension 0.3–0.5 mm long, pubescent.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa. Rwanda.

Agrostis jahnii Luces. *Bol. Soc. Venez. Cienc. Nat.* 15: 12. (1953).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Venezuela, Merida: Jahn 1044 (VEN holo, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Alfredo Jahn (1867–1940) who collected in Venezuela.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, slender, 20–30 cm long. Culm-internodes smooth or scaberulous. Leaves mostly basal. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1.5–2 mm long, obtuse. Leaf-blades flat or conduplicate, 5–7 cm long, 1.5–2 mm wide. Leaf-blade surface scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 7–11 cm long. Primary panicle branches ascending, whorled at most nodes. Panicle branches stiff. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.7–2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume oblong, 1.7–2 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume oblong, 1.7–2 mm long, 1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma apex dentate, 4 -fid, truncate, muticous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.
Country /Province /State. Northern South America, Western South America. Venezuela. Colombia.

Agrostis joyceae S.W.L.Jacobs. *Telopea* 9(3): 680 (2002).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New South Wales: Southern Tablelands: Prussian Creek, alt. 5600 ft (1707 m), Kosiuszko [as Kosiusko] National Park, in leaf litter on rock ledge, 1 Feb 1974, *J. Thompson 2031* (HT: NSW-506464).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (110).

Derivation (Clifford & Bostock 2007): in honor of Joyce Winifred Vickery (1908–1979) Australian botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Culms erect or geniculately ascending, slender, 20–40 cm long, 2 -noded. Culm-internodes striate. Leaves mostly basal. Leaf-sheaths loose. Ligule an eciliate membrane, 3.5 mm long, obtuse. Leaf-blades 1–1.5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, nodding, 6–12 cm long. Panicle branches flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, flexuous, 2.5–5 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.8–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 1 mm long or 8–25 mm long, 1 length of upper glume, membranous, light green or purple, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.8–2.5 mm long, 1.2–1.4 length of adjacent fertile lemma, membranous, light green or purple, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma oblong, 1.5–1.8 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, mucicous. Palea absent or minute.

Flower and Fruit. Anthers 3, 0.4–0.5 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales. Tablelands.

Agrostis juergensii Hack. Fedde, *Repert* 7: 318 (1909).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil, Porto dos Dorados: Juergens 190 (W holo, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Carlo Juergens (fl. 1905) who collected in Brazil.

Classification. Subfamily Pooideae. Tribe: Poeae.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northeast. Buenos Aires.

Agrostis juressii Link. *Schrad. Journ.* 2: 312. (1799).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Spain. **Basionym or Replaced Name:** *Linkagrostis juressii* (Link) A.T.Romero Garcia, G.Blanca & C.MoralesTorre, *Candollea*, 42(1) : 383 (1987). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Spain, Gerez: Coll?.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. from Serra de Gerez, Portugal.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Culms geniculately ascending, 40–60 cm long. Culm-internodes smooth. Lateral branches lacking. Leaf-sheaths without keel, smooth, glabrous on surface. Ligule an eciliate membrane, 0.5–1 mm long, truncate. Leaf-blades 6–12 cm long, 4–9 mm wide. Leaf-blade surface smooth. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, continuous or interrupted, 5–10 cm long, 0.5–1.5 cm wide. Primary panicle branches 2–3 -nate. Panicle axis scaberulous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous, tip rectangular.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume oblong, 3 mm long, 1 length of upper glume, chartaceous, purple, 1-keeled, 3 -veined. Lower glume lateral veins obscure. Lower glume surface scabrous. Lower glume apex acute. Upper glume oblong, 3 mm long, 1.2 length of adjacent fertile lemma, chartaceous, purple, 1-keeled, 3 -veined. Upper glume lateral veins obscure. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 2.5 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface smooth or asperulous, rough above. Lemma apex dentate, 4 -fid, obtuse, mucous. Palea 0.1–0.5 mm long, 0.05–0.2 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.3 mm long, membranous. Anthers 3, 1 mm long, yellow. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Europe, Africa.

Region. Southwestern Europe.

Country /Province /State. : Portugal, Spain. **Northern Africa.** Morocco.

Agrostis keniensis Pilger. *Notizbl. Bot. Gart. Berlin* 9: 513 (1926).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Kenya. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Kenya, Mt. Kenya: *Fries 1465* (UPS holo).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (48, Fig. 22).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Kenya.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 70–120 cm long, 3–4 -noded. Ligule an eciliate membrane, 4–5 mm long, lacerate, truncate. Leaf-blades flat, 10–20 cm long, 2–3 mm wide. Leaf-blade surface scaberulous, rough adaxially, glabrous. Leaf-blade apex obtuse, hardened.

Inflorescence. Inflorescence a panicle. Panicle open, linear or oblong, loose or effuse, 15–25 cm long, 5–7 cm wide. Primary panicle branches ascending. Panicle branches capillary, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–6 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension or with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 3–4 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.7–3.7 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 2.5–3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface pilose. Lemma hairs 1 mm long. Lemma apex truncate,

awned, 1 -awned. Principal lemma awn dorsal, arising 0.3–0.4 way up back of lemma, geniculate, 3.5–5 mm long overall, with a straight or slightly twisted column. Palea 0.9 length of lemma, hyaline, 2 -veined. Rhachilla extension 0–0.2 length of fertile floret, pubescent.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa, East Tropical Africa. Ethiopia (inc. Eritrea). Kenya, Tanzania.

Agrostis kilimandscharica Mez. Fedde, *Repert.* 18: 2 (1922).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Tanzania. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Tanzania, Kilimanjaro: *Volkens 1831* (B holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Mt. Kilimandjaro, East Africa.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, culms solitary or caespitose. Culms erect or geniculately ascending or decumbent, 30–90 cm long, 1–2 mm diam. Ligule an eciliate membrane. Leaf-blades 5–20 cm long, 1–4 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear or oblong or ovate, 5–22 cm long. Primary panicle branches ascending or spreading. Panicle branches flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension or with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 2.5–3(–4.5) mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose.

Glumes. Glumes persistent, similar, with lower wider than upper, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 2.5–4.5 mm long, 0.75–0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface smooth. Lower glume apex acuminate. Upper glume lanceolate, 2–4 mm long, 1.7–1.8 length of adjacent fertile lemma, membranous, eglandular or glandular (beside keel), 1-keeled, 1–3 -veined. Upper glume primary vein scaberulous. Upper glume surface smooth. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 1.5–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface pilose. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1–0.25 way up back of lemma, geniculate, 3–6 mm long overall, with twisted column. Palea 1 length of lemma, hyaline, 2 -veined. Rhachilla extension 0–0.25 length of fertile floret (0–1mm), pilose.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa. Rwanda, DRC. Ethiopia (inc. Eritrea), Sudan. Kenya, Tanzania, Uganda.

Agrostis kolymensis V.B. Kuvaev & A.P. Khokhryakov. *Novosti Sist. Vyssh. Rast.*, 19: 4 (1982).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Magadanica, Omsikizan: Kuvajev 40–4 (LE holo, MW).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From the Kolyma Basin, north-eastern Siberia.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms erect, 40–45 cm long. Culm-internodes smooth. Ligule an eciliate membrane, 3 mm long, lacerate. Leaf-blades flat or convolute, 0.6–2.2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 6–16 cm long, 5 cm wide. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3 mm long, 1.2–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, muticous or awned, 1 -awned. Principal lemma awn subapical, straight, 0.6–0.8 mm long overall. Palea present or absent or minute, 0–1.6 mm long, hyaline.

Flower and Fruit. Anthers 3, 0.7 mm long, yellow.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Russian Far East. Magadan.

Agrostis korczaginii Senjan.-Korcz. *Not.Syst. Herb. Inst. Bot. Acad. Sci. URSS*, 15: 28 (1953).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Chetlas R.: *Korchagin* (LE holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Aleksandr Alexandrovich Korchagin (1900-) Russian botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, 25–50 cm long. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1.3–1.6 mm long, entire or lacerate, obtuse. Leaf-blades 6.5–9.5 cm long, 2.5 mm wide. Leaf-blade surface scabrous, rough on both sides. Leaf-blade margins scabrous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 4–12 cm long, 0.8–1 cm wide. Primary panicle branches 4–9 -nate, whorled at most nodes, 2.5–3 cm long. Panicle branches capillary, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 2.2–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.3–0.4 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 2.2–3 mm long, 1.1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acute. Upper glume lanceolate, 2.1–2.7 mm long, 1.1–1.3 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acute.

Florets. Fertile lemma oblong or ovate, 2–2.1 mm long, 0.8–1.1 mm wide, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface asperulous, puberulous. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33 way up back of lemma, straight or geniculate, 3.5–3.7 mm long overall, without a column or with twisted column. Palea 0.8–0.9 mm long, 0.33–0.5 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, lanceolate, 0.3–0.4 mm long, membranous. Anthers 3, 1.2–1.7 mm long. Stigmas 2, laterally exerted. Caryopsis with adherent pericarp, apex unappendaged. Hilum punctiform.

Distribution (TDWG). Continent. Europe.

Region. Eastern Europe.

Country /Province /State. East European Russia, North European Russia.

Agrostis kunmingensis B.S.Sun & Y.C.Wang. *Acta Phytotax. Sin.*, 30(4): 364 (1992).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Yunnan, Kunming: Qiu 50508 (KUN holo).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 470).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Kunming, Yunnan Province, China.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms geniculately ascending, 35–70(–100) cm long, 1–2.6 mm diam., 3–7 -noded. Leaf-sheaths smooth. Ligule an eciliate membrane, 2.5–4 mm long, scaberulous on abaxial surface, obtuse. Leaf-blades flat or convolute, 10–16 cm long, 2.5–4 mm wide. Leaf-blade surface scaberulous, rough on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or ovate, 10–20(–25) cm long. Primary panicle branches ascending, 2–6 -nate, whorled at most nodes, 7–12 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 2.5–3.2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.3 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.5–3.2 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong or ovate, 1.6–2.1 mm long, hyaline, without keel, 4–5 -veined, more than 3-veined. Lemma lateral veins prominent. Lemma surface scaberulous, rough above. Lemma apex truncate, mucous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.5–0.66 way up back of lemma, straight, 1 mm long overall. Palea 0.2–0.5 mm long, 0.15–0.3 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Anthers 3, 1–1.5 mm long.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central.

Sichuan, Yunnan.

Agrostis kuntzei Mez. *Repert. Spec. Nov. Regni Veg.* 17(19–30): 300. 1921.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Polypogon*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *O. Kuntze s.n.*, 22–29 Jan 1892, Chile: Paso Cruz, 34 degrees, 2100 m (?; IT: BAA, LP, NY, NY, US-75951 (fragm. & photo ex NY hb. Kuntze), US-75952 (fragm. & photo ex NY hb. Kuntze)).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (113), M.N.Correra, *Flora Patagonica* Parte III, Gramineae (1978) (390, Fig. 258).

Derivation (Clifford & Bostock 2007): in honor of Carl Ernst Otto Kuntze (1843–1907) German botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Distribution (TDWG). Continent. South America.
Country /Province /State. Southern South America. Argentina Northwest, Chile Central.
Catamarca, Jujuy, Mendoza, San Juan. Chaco. Neuquén, Santa Cruz. Rest of Chile- Biobio, La
Auracania, Maule, O'Higgins, Santado, Valpariso. Coquimbo, Santiago, Biobio.

Agrostis lachnantha Nees. *Ind. Sem. Hort. Bot. Vratisl.* (1834). (1834).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: South Africa, Zwartskops R.: Drege (K iso).

Illustrations (Books): T. Cope & A. Gray, *Grasses of the British Isles* (98), L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (100, Fig. 72, as *A. huttoniae*; 101, Fig. 73), S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (48, Fig. 22 as *A. huttoniae*).

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): Gk. *lachnos*, wool; *anthos*, flower. Spikelets wooly.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual or perennial, short-lived. Culms erect or geniculately ascending, 30–90 cm long, without nodal roots or rooting from lower nodes. Ligule an eciliate membrane. Leaf-blades flat, 7–20 cm long, 2–4 mm wide, flaccid, light green.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, 5–30 cm long, 1–3 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2–2.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acute. Upper glume lanceolate, 2–2.5 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.5–2 mm long, hyaline, without keel, 3 -veined, 0–3 -veined. Lemma surface glabrous (rarely) or pubescent or pilose. Lemma hairs 0.5–1 mm long. Lemma apex erose, obtuse, mucicose or mucronate (0–0.5mm). Principal lemma awn subapical. Palea 0.9 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.5–0.8 mm long. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

n = 21 (1 ref TROPICOS).

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia, Antarctica.

Region. Northern Europe (*).

Country /Province /State. : Great Britain (*). **West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa.** Rwanda. Eritrea, Ethiopia (inc. Eritrea), Sudan. Tanzania, Uganda. Angola, Malawi, Zambia, Zimbabwe. Agrostis lacuna-vernalis P.M.Peterson & Soreng. *J.Bot.Res.Inst. Texas* 5(2): 421–426 (2011).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: California, Monterey Co., Fort Ord Army Military Base, Butterfly Valley, 2.8 km SSW of East Garrison and 9 km SW of Salinas, *R.Morgan, D.Styer & D. Neubauer s.n.* (holo: US-3621794).

Illustrations (Journals): *J. Bot. Res. Inst. Texas* (5(2): 423, Fig.1 (2011)).

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Basal innovations intravaginal. Culms erect or geniculately ascending or decumbent, slender, (1.5–)5–30 cm long, 0.25 mm diam., 2–3 -noded. Culm-internodes smooth. Culm-nodes brown, glabrous. Lateral branches lacking. Leaves basal and cauline. Leaf-sheaths open for most of their length, mostly shorter than adjacent culm internode. Ligule an eciliate membrane, 1.2–1.7 mm long, erose, obtuse or acute. Leaf-blades flat or conduplicate or involute, (1.4–)5–11 cm long, 0.3–1(–1.5) mm wide. Leaf-blade surface scabrous, rough abaxially, glabrous. Leaf-blade margins scaberulous.

Inflorescence. Inflorescence a panicle, comprising 12–90(–100) fertile spikelets. Panicle spiciform, linear, 1–7.5 cm long, 0.1–0.6 cm wide. Primary panicle branches 1–3 -nate, 0.6–1.4 cm long. Panicle branches capillary, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.5–2.4 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume ovate, 1.5–2.4 mm long, 1 length of upper glume, herbaceous or scarious, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acute. Upper glume ovate, 1.5–2.4 mm long, herbaceous or scarious, 1-keeled. Upper glume primary vein scaberulous. Upper glume surface scabrous. Upper glume margins scaberulous. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.1–1.5 mm long, hyaline, light green and purple (at tip), shiny, without keel, 5 -veined, more than 3-veined. Lemma midvein extending to apex. Lemma lateral veins obscure. Lemma surface smooth, glabrous. Lemma apex truncate or obtuse, muticous. Palea 0.7–1.1 mm long, 0.5–0.66 length of lemma, hyaline. Palea apex obtuse.

Flower and Fruit. Lodicules 2, 0.4–0.5 mm long. Anthers 3, 0.4–0.7 mm long, yellow. Ovary glabrous. Caryopsis with adherent pericarp, ellipsoid, dorsally compressed, sulcate on hilar side, 0.9–1.2 mm long, light brown. Embryo 0.25 length of caryopsis. Hilum punctiform.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southwestern USA. California.

Agrostis lacunis D.I.Morris. *Muelleria*, 7(2): 149 (1990).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia, Tasmania, Twisted Tarn: Buchanan 1187 (HO holo, AD, CANB, CHR, MEL, NSW).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L lacuna*, pond. Grwing around the margins of ponds.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Butt sheaths papery, glabrous. Culms erect or geniculately ascending, 20–40 cm long, without nodal roots or rooting from lower nodes. Leaf-sheaths loose, longer than adjacent culm internode, ribbed. Ligule an eciliate membrane, 3–6 mm long, acute. Leaf-blades 10–20 cm long, 1.5–2.5 mm wide. Leaf-blade surface ribbed, grooved adaxially and abaxially, scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Peduncle scaberulous above. Panicle open, pyramidal, 6–12 cm long, 4–7 cm wide. Primary panicle branches 2–4 -nate. Panicle axis scabrous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2.75–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate or elliptic, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex acute. Upper glume lanceolate or elliptic, 2.75–4 mm long, membranous, purple, 1-

keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface scabrous. Upper glume apex acute.

Florets. Fertile lemma oblong, 2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex dentate, 4 -fid, truncate, awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight or geniculate, 1.5–3.25 mm long overall, with a straight or slightly twisted column. Column of lemma awn 1.5 mm long. Palea 0.9 length of lemma, hyaline, 2 -veined. Rhachilla extension 0.5 mm long, pubescent, with 0.5 mm long hairs.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.6–0.8 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Tasmania.

Agrostis laxissima Swallen. *Contrib. U. S. Nat. Herb.* 29: 402 (1950).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Guatemala. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Guatemala, San Marcos: Standley 85379 (US holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. laxus*, lax; *-issima*, most. Panicle very open.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, weak, 50–60 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 3–4 mm long. Leaf-blades 8–15 cm long, 1–3 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 7–8 cm long, bearing few spikelets. Primary panicle branches ascending or spreading. Panicle branches flexuous, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 2 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2 mm long, 1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33 way up back of lemma, curved, 3 mm long overall. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Southeast Mexico. **Mesoamerica.** Guatemala, Honduras. Chiapas.

Agrostis lazica Balansa. *Bull. Soc. Bot. Fr.* 21: 12. (1874).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Turkey. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Turkey, Lazistan: *Balansa 1542* (G holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ica*, belonging to. From Lazica, now Lazistan, Turkey.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms erect or geniculately ascending, 5–30 cm long. Culm-internodes smooth, distally glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1.5–2 mm long, truncate. Leaf-blades conduplicate, 2–7.5 cm long, 0.8–2 mm wide. Leaf-blade surface scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, linear or oblong, dense, 2–8 cm long, 0.4–2 cm wide. Primary panicle branches appressed, 0.5–3 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, linear, terete, 0.5–1.5 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 2–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.1–0.2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–2.5 mm long, 1.1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic to oblong, 1.8–2 mm long, hyaline, without keel, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25–0.33 way up back of lemma, straight, 2–2.5 mm long overall, clearly exerted from spikelet. Palea oblong, 0.8–1 mm long, 0.5 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 0.6–0.8 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Caucasus, Western Asia. Iran.

Agrostis lehmannii Swallen. *Contrib. U. S. Nat. Herb.* 29: 263 (1948).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Colombia, Paramo de Purace: Kilip & Lehmann 38598 (US holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of F.C. Lehmann (fl. 1944) United States botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms geniculately ascending, 20–40 cm long. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, glabrous on surface. Ligule an eciliate membrane, 7–8 mm long, pubescent on abaxial surface, lacerate. Leaf-blades 6–8 cm long, 2.5–3 mm wide. Leaf-blade surface scaberulous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 13 cm long, 3 cm wide. Primary panicle branches ascending or spreading, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 3–3.5 mm long, 1.1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface glabrous. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 6 mm long overall, with a straight or slightly twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, 0.7 mm long, membranous. Anthers 3, 0.6 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Agrostis lenis Roseng. Arrill. de Moffei & Izag. de Artucio, *Gramin. Urug.* 23 (1970).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uruguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Uruguay, Curticeiras to Farrapos: Rosengurt B-7107 (MVFA holo).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina 3 – 2 Pooideae* (2012) (113), L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (476, Fig. 102), B.Rosengurt, *Gramineas Uruguayas I* (1970) (18, Fig. 1).

Derivation (Clifford & Bostock 2007): L. soft. Leaf-blades softly hairy.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Stolons present. Basal innovations extravaginal. Culms decumbent, weak, 40–80 cm long, 6–10 -noded, rooting from lower nodes. Lateral branches lacking or sparse. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1–4 mm long, erose, truncate. Leaf-blades involute, 5–12 cm long, 1–3 mm wide. Leaf-blade surface smooth or scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 10–24 cm long, 5–8 cm wide. Primary panicle branches 2–5 -nate, whorled at most nodes, rebranched at middle. Panicle axis with lower internodes 3–8 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1.5–5 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.5–2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, hairy in 2 tufts.

Glumes. Glumes persistent, similar, reaching apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1.5–2 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.5–2 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1–1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, muticous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.3–0.6 mm long. Caryopsis with adherent pericarp, ellipsoid or ovoid, sulcate on hilar side, 0.8–1 mm long, dark brown. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil, Southern South America. Bolivia. Brazil Southeast, Brazil South. Uruguay.

Sao Paulo Parana, Catarina, Rio Grande do Sul. Sao Paulo. Paraná, Rio Grande do Sul, Santa Catarina. Tucuman.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Chile, Valdivia: Gay (P lecto, BAA, K).

Recent Synonyms: *Agrostis fuegiana* Hack. ex P. Dusen, in *Ergebn. Schwed. Exp. Magell.* 3(5) 220. (1900).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina 3 – 2 Pooideae* (2012) (114), M.N.Correa, *Flora Patagonica Parte III, Gramineae* (1978) (377, Fig. 251).

Derivation (Clifford & Bostock 2007): Gk. *leptos*, narrow; *thrix*, hair. Inflorescence branches very thin.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent or short. Culms 20–50 cm long. Ligule an eciliate membrane, 3–4 mm long, lacerate. Leaf-blades 1–2.5 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, nodding, 9–20 cm long. Primary panicle branches appressed or ascending. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus sparsely hairy.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–3.5 mm long, 1.3–1.6 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.5–2.2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, mucronate or awned, 1 -awned. Principal lemma awn dorsal, arising 0.66–0.75 way up back of lemma, straight, 0.2–1 mm long overall. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.8–1.5 mm long. Caryopsis with adherent pericarp, ovoid. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina South, Chile Central, Chile South.

Chubut, Neuquén, Río Negro, Santa Cruz. Tarapaca, Antofagasta, Atacama, Coquimbo, Rest of Chile-Biobio, La Auracania, Maule, O'Higgins, Santado, Valpariso, Chiloe, Aisen, Magellanes. Valparaiso, Maule, Biobio, La Araucania. Los Lagos, Aisen, Magellanes.

Agrostis liebmannii (Fourn.) Hitchc. *N. Amer. Fl.* 17(7):519 (1937).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. **Basionym or Replaced Name:** *Apera liebmannii* P. Fourn., *Gram. Mexic.* 97 (1886). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mexico, Orizaba: Botter 93 (P syn) ; Mexico, Chinantla: Liebmann 710 (C syn, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Frederik Michael Leibmann (1813–56), Danish botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending, 30–40 cm long. Culm-internodes distally glabrous. Lateral branches lacking. Leaf-sheaths scaberulous. Ligule an eciliate membrane, 2 mm long, erose, truncate. Leaf-blades 2–8 cm long, 2–3 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 10–16 cm long. Primary panicle branches ascending. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.5 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex acute, mucicous. Palea 0.9 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.7 mm long, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Central Mexico, Northeast Mexico, Gulf (Mexico), Southwest Mexico. **Western South America.** Colombia.

Distrito Federal, Mexico State, Puebla. Durango, Queretaro. Veracruz. Oaxaca.

Agrostis longiberbis Hack. ex L.B. Smith. *Phytologia* 22 (2): 88, (1971).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: : Based on *Calamagrostis capillaris* ; Brazil: Sellow 521 (B holo, K).

Recent Synonyms: *Calamagrostis capillaris* Nees ex Steud., *Syn. Pl. Gram.* 188. (1854).

Illustrations (Books): L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (476, Fig. 102).

Derivation (Clifford & Bostock 2007): *L. longus*, long; barba, beard.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose, clumped densely. Culms 60–90 cm long, 0.5 mm diam. Ligule an eciliate membrane. Leaf-blades flat or conduplicate, 2 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 8–30 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded. Floret callus hairs 0.9–1 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 2–3 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–3 mm long, 1.5–1.6 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.6 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 2 -fid, mucicous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast, Brazil South.

Sao Paulo Parana, Catarina, Rio Grande do Sul. Rio de Janeiro, Sao Paulo. Paraná, Rio Grande do Sul.

Agrostis mackliniae Bor. *Kew Bull.* 1957, 417 (1958).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from Myanmar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Burma, Mount Victoria: *Kingdon-Ward 21979* (K holo).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 461).

Derivation (Clifford & Bostock 2007): in honor of Jean Macklin (fl. 1955–56), otherwise Mrs. Kingdon-Ward.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Culms 15–30 cm long. Culm-nodes glabrous. Ligule an eciliate membrane, 5 mm long. Leaf-blades conduplicate or convolute, 3–

10 cm long, 2–3 mm wide. Leaf-blade surface scaberulous, rough on both sides, glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, 3–7 cm long, 0.5 cm wide. Primary panicle branches 1.8 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate or elliptic, 2.5–3 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate or elliptic, 2.2–2.7 mm long, 1.5–1.7 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, 1.5 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma apex acute, muticous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.75 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, Tibet. **Indo-China.** Myanmar. Yunnan.

Agrostis magellanica Lam. *Illustr.* 1: 160 (1791).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from Chile. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Chile, Magellan: Coimerson (P holotype).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (115), M.N.Correa, *Flora Patagonica* Parte III, Gramineae (1978) (390, Fig. 261).

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From the Straits of Magellan.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths light brown, persistent and investing base of culm, with fibrous dead sheaths. Basal innovations extravaginal. Culms erect or geniculately ascending or decumbent, 5–45 cm long. Ligule an eciliate membrane, 1.5 mm long, scaberulous on abaxial surface, erose, truncate. Leaf-blades flat or conduplicate, 2–16 cm long, 0.5–2 mm wide. Leaf-blade surface ribbed, scaberulous, rough adaxially. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle, aerial or shorter than basal leaves. Peduncle smooth or scaberulous above. Panicle contracted, lanceolate or elliptic, 2–10 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 1.5–5 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3.5–5 mm long, falling entire, deciduous with the pedicel. Floret callus pubescent, hairy in 2 tufts.

Glumes. Glumes similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 3.5–5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acuminate. Upper glume lanceolate, 3.5–5 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acuminate.

Florets. Fertile lemma ovate, 1.8–2.2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma surface smooth or scaberulous, rough above or on veins. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way

up back of lemma, geniculate, 3–4 mm long overall, with twisted column. Palea 0.4–0.7 mm long, 0.25 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.5–0.6 mm long, membranous. Anthers 3, 0.5–0.9 mm long. Caryopsis with adherent pericarp, 1.2–1.6 mm long. Hilum linear.

$n = 42$ (1 ref TROPICOS). $2n = 84$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Australasia, South America, Antarctica.

Country /Province /State. **New Zealand.** Antipodes Is, New Zealand South I, Campbell Is, Auckland Is, Macquarie Is. **Western South America, Southern South America.** Colombia. Argentina South, Chile Central, Chile South. **Subantarctic islands.** Crozet Is, Falkland Is (Malvinas), Kerguelen, Macquarie Is, Marion-Prince Edward Is, South Georgia.

Chubut, Neuquén, Río Negro, Santa Cruz, Tierra del Fuego. La Araucania. Los Lagos, Aisen, Magellanes.

Agrostis mannii (Hook.f.) Stapf, in obs. Dyer, *Fl. Cap.* 7: 549 (1889).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cameroon. **Basionym or Replaced Name:** *Deyeuxia mannii* Hook. f., *Journ. Linn. Soc.* 7: 228. (1864). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Bioko / Cameroon Mt.

Illustrations (Books): H.Jacques-Felix, *Les Graminees d'Afrique tropicale* (1962) (191, Fig. 113), S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (50, Fig. 23 as subsp. *aethiopica*).

Derivation (Clifford & Bostock 2007): in honor of Gustav Mann (1836–1916) German botanist and plant collector employed as gardener at Royal Botanic Gardens, Kew, England.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending or decumbent, 25–90 cm long. Ligule an eciliate membrane, 3–5 mm long. Leaf-blades flat or involute, 5–25 cm long, 1.5–3.5 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, oblong or ovate, dense or loose, 2–10 cm long. Panicle branches flexuous, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 0.6–2 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.5–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose.

Glumes. Glumes persistent, similar, subequal in width, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 3.5–5 mm long, 1 length of upper glume, membranous, 1-keeled, 1–2 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent or obscure. Lower glume surface smooth. Lower glume apex acute. Upper glume lanceolate, 3.5–5 mm long, 1.4–1.7 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume surface smooth. Upper glume apex acute.

Florets. Fertile lemma oblong, 2.5–3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface pilose. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1–0.25 way up back of lemma, geniculate, 3–7 mm long overall, with twisted column. Palea 1 length of lemma, hyaline, 2 -veined. Rhachilla extension 0.2–0.3 length of fertile floret, pilose.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

$2n = 28$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. **West-Central Tropical Africa, Northeast Tropical Africa.** Cameroon, Annobon, Principe & Sao Tome, Bioko. Ethiopia (inc. Eritrea).

Agrostis marojejyensis A. Camus. *Bull. Soc. Bot. France*, 97: 80 (1950).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Madagascar, Marojejy: Humbert 22736 ; Madagascar, Marojejy: Humbert 23710.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Marojejy Mts, Madagascar.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 40–60 cm long, 4–5 -noded. Culm-internodes striate, smooth. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths striately veined, smooth, glabrous on surface. Ligule an eciliate membrane, 2.8–3 mm long, lacerate, truncate. Leaf-blades 8–15 cm long, 1.5–2.5 mm wide. Leaf-blade surface glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 8–12 cm long. Primary panicle branches appressed, 4–5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 5–10 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 4.3–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 4.3–4.5 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface puberulous. Lower glume apex acuminate. Upper glume lanceolate, 4.1–4.2 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1–3 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent or obscure. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 2.5–3 mm long, hyaline, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins prominent, excurrent. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 6 mm long overall, with twisted column. Column of lemma awn 3 mm long. Palea 1–1.5 mm long, hyaline.

Flower and Fruit. Anthers 3, 1.5–2 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Agrostis masafuerana Pilg. *Repert. Spec. Nov. Regni Veg.* 16: 388. 1920.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *C. Skottsberg & I. Skottsberg 424*, 14 Feb 1917, Chile: Juan Fernandez Islands: Masafuera, highland of Las Torres, alpine heath, ca. 1300 m (B; IT: BAA-4273 (fragm. ex B), K, P, SGO (fragm. ex B), US-1093816).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -anus*, indicating location. From Mas Afuera an island close to Juan Fernandez.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect, 30–40 cm long, 3–4 -noded. Culm-internodes brown, distally glabrous. Lateral branches lacking. Leaf-sheaths 2–8 cm long, striately veined, glabrous on surface. Ligule an eciliate membrane, 3–3.5 mm long, erose, acute. Leaf-blades 3–10 cm long, 2–3 mm wide. Leaf-blade surface smooth. Leaf-blade margins scaberulous.

Inflorescence. Inflorescence a panicle, exserted or embraced at base by subtending leaf. Panicle contracted, linear or oblong, 7–12 cm long, 1–2 cm wide. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1.5–4.5 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.5–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus sparsely hairy, hairy on the margins.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface smooth or asperulous. Lower glume apex acuminate. Upper glume lanceolate, 3.5–4.5 mm long, membranous, purple, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume lateral veins distinct. Upper glume surface smooth or asperulous. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, 1.5–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface scaberulous, rough on veins. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.66 way up back of lemma, straight, 0.5–1.2 mm long overall, not or scarcely exerted from spikelet. Palea 0.2–0.3 mm long, 0.1–0.15 length of lemma, 0 -veined. Palea apex dentate, 3 -fid.

Flower and Fruit. Lodicules 2, 0.4–0.5 mm long, membranous. Anthers 3, 0.8–1 mm long. Caryopsis with adherent pericarp, ellipsoid, 1–1.5 mm long. Hilum elliptic. Endosperm farinose.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Juan Fernandez Is.

Agrostis media Carmich. *Trans. Linn. Soc. London* 12: 504. 1819.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Tristan da Cunha. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: South Atlantic, Tristan da Cunha: Carmichael.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. middle. Characters midway between two or more other species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 10–25 cm long. Ligule an eciliate membrane, 1.5–2 mm long, erose, obtuse. Leaf-blades filiform, convolute, 2–5 cm long, 0.5–1 mm wide. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, aerial, exerted. Panicle contracted, linear, 1–4 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3.5–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acuminate. Upper glume lanceolate, 3.5–4 mm long, 5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acute.

Florets. Fertile lemma oblong, 0.7 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, awned, 1 -awned. Principal lemma awn subapical, straight, 0.5–1 mm long overall. Palea 0.75 length of lemma, hyaline.

Distribution (TDWG). Continent. Antarctica.

Country /Province /State. Subantarctic islands. Tristan de Cunha.

Agrostis meridensis Lucas. *Bol. Soc. Venez. Cienc. Nat.* 15: 11 (1953).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Venezuela, Paramo de Muchuchies: Lucas 267 (VEN holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Mirida, Venezuela.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending, slender, 45 cm long. Culm-internodes smooth. Culm-nodes glabrous. Lateral branches sparse. Leaf-sheaths longer than adjacent culm internode, pubescent. Ligule an eciliate membrane, 1–2 mm long, lacerate, obtuse. Leaf-blades 7–15 cm long, 3–7 mm wide. Leaf-blade surface scabrous. Leaf-blade margins ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle open, ovate, 10–15 cm long. Primary panicle branches whorled at most nodes. Panicle branches capillary, flexuous, scaberulous. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.5–3.8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus sparsely hairy or pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3.5–3.8 mm long, 1 length of upper glume, membranous, much thinner on margins, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface hispidulous. Lower glume apex acute. Upper glume lanceolate, 3.5–3.8 mm long, 1.5–1.6 length of adjacent fertile lemma, membranous, with hyaline margins, 1-keeled, 3 -veined. Upper glume surface hispidulous. Upper glume apex acute.

Florets. Fertile lemma ovate, 2.2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface hispidulous. Lemma apex entire, obtuse, muticous. Palea 0.25 length of lemma. Rhachilla extension 0.25 length of fertile floret, pilose.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Agrostis mertensii Trin. *Linnaea* 10: 302 (1835).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983) (& as *A. borealis*), T.Koyama, *Grasses of Japan and its neighboring regions* (1987) (as *A. borealis*).

TYPE from Aleutian Islands. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Aleutian Is., Unalaska: Mertens (LE lecto).

Recent Synonyms: *Agrostis trichantha* (Schischk.) Tsvelev, *Novosti Sist. Vyssh. Rast.*, 8: 59 (1971).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (115), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (645).

Derivation (Clifford & Bostock 2007): in honor of Carl Heinrich Mertens (1796–1830) German-born physician and traveller.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 20–60 cm long. Lateral branches lacking. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1–2 mm long. Leaf-blades flat or involute, 5–10 cm long, 0.5–3 mm wide. Leaf-blade surface smooth or scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 5–15 cm long. Primary panicle branches spreading, whorled at lower nodes, 1–4 cm long. Panicle axis smooth or scabrous. Panicle branches smooth or scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 2.5–3 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.5–3 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight or geniculate, 2–4 mm long overall, without a column or with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.75–1.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

TYPE from Greece. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Greece, Mt. Grammos: Greuter 14360 (ATH iso, B, C, G, M).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Hermann Merxmüller (1920–1968) German botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Stolons absent or present. Basal innovations intravaginal. Culms geniculately ascending, 30–50 cm long, rooting from lower nodes. Culm-internodes smooth, distally glabrous. Leaf-sheaths scaberulous. Ligule an eciliate membrane, 2–5 mm long. Leaf-blades flat or involute, 7–14 cm long, 1–2.3 mm wide, glaucous. Leaf-blade surface ribbed. Leaf-blade margins scaberulous or scabrous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 7–10 cm long, 1–2 cm wide. Primary panicle branches appressed, whorled at most nodes. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–3 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 3–3.7 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 3–3.7 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex acute. Upper glume lanceolate, 2.9–3.6 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface scabrous. Upper glume apex acute.

Florets. Fertile lemma elliptic to oblong, 2.4–2.7 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, mucronate. Palea oblong, 1.4 mm long, 0.5 length of lemma, hyaline, 0–2 -veined.

Flower and Fruit. Anthers 3, 1.5–1.8 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Europe.

Region. Southeastern Europe.

Country /Province /State. : Greece.

Agrostis meyenii Trin. *Mem. Acad. Petersb. Ser. 6: 6: 2: 312.* (1841).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Chile, Santa Fernando: Coll? (LE holo).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina 3 – 2 Pooideae* (2012) (116), S.A.Renvoize, *Gramineas de Bolivia* (1998) (178, Fig. 43), M.N.Corraea, *Flora Patagonica Parte III, Gramineae* (1978) (377, Fig. 252).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Franz Julius Ferdinand Meyen (1804–1840) German physician, traveller and plant collector.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Rhizomes absent or short. Culms 2–18 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1–2.5 mm long, erose, truncate or obtuse. Leaf-blades curved, filiform, conduplicate, 0.5–1.5 mm wide. Leaf-blade surface scabrous, rough adaxially or on both sides.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 1–6.5 cm long, 0.3–0.7 cm wide. Panicle branches smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.4–4.1 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface scabrous, rough above. Lower glume apex acute. Upper glume lanceolate, 2.4–4.1 mm long, 1.4–1.6 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface scabrous. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.7–2.6 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, obtuse, mucicous or mucronate or awned, 1 -awned. Principal lemma awn dorsal, arising 0.66–0.75 way up back of lemma, straight, 1–2 mm long overall, not or scarcely exerted from spikelet. Palea 0.35–0.7 mm long, hyaline, 0 -veined.

Flower and Fruit. Lodicules 2, 0.25–0.55 mm long, membranous. Anthers 3, 0.5–0.8 mm long. Caryopsis with adherent pericarp, 1.1–1.6 mm long. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Southern South America. Bolivia. Argentina South, Chile Central, Chile South. Falkland Is (Malvinas).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from Nepal. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Nepal: Wallich 3776 .

Illustrations (Books): K.M.Matthew, *Flora Palni Hills* (1996) (777, Pl. 777), H.J.Noltie, *The Grasses of Bhutan* (2000) (601, Fig. 25), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 461).

Derivation (Clifford & Bostock 2007): Gk. *mikros*, small; anthos, flower. Spikelets small.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–100 cm long. Culm-internodes scaberulous. Leaf-sheaths scaberulous. Ligule an eciliate membrane, 2–3 mm long. Leaf-blades 8–15 cm long, 3–4 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, elliptic, 10–25 cm long. Primary panicle branches whorled at lower nodes. Panicle branches capillary, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, clavate.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.75 mm long, breaking up at maturity, disarticulating below each fertile floret. Spikelet callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2 mm long, 1–1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.75–2 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, mucicous. Palea 0.2–0.5 mm long, 0.1–0.33 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.6 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, Qinghai, China Southeast, Tibet. **Indian Subcontinent, Indo-China.** Assam, Eastern Himalaya, India, Nepal, West Himalaya. Myanmar.

Shaanxi, Anhui, Fujian, Guangxi, Henan, Hunan, Jiangxi, Guizhou, Hubei, Sichuan, Yunnan. Darjeeling, Bhutan, Sikkim. Assam, Meghalaya. Uttah Pradesh. Himachal Pradesh, Jammu Kashmir.

Agrostis microphylla Steud. *Syn. Pl. Gram.* 164 (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006) (& as *A. inflata*).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: North America: Douglas.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (659).

Derivation (Clifford & Bostock 2007): Gk. *mikros*, small; phyllon, leaf. Leaf-blades short. *Agrostis microphylla*.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 5–15 cm long. Leaf-sheaths longer than adjacent culm internode. Ligule an eciliate membrane, 2–2.5 mm long. Leaf-blades 1.5–6 cm long, 0.5–2.3 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, 3–6 cm long, 0.5–0.8 cm wide. Primary panicle branches appressed, 0.5–2 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.5–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose. Floret callus hairs 0.15 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic, 3.5–4 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acuminate, awned, 1 -awned, awn 1–2 mm long. Upper glume elliptic, 3.5–4 mm long, 1.1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume surface asperulous. Upper glume apex acuminate, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma oblong, 3.2–3.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5–0.6 way up back of lemma, geniculate, 6–7 mm long overall, with twisted column. Palea 0.3 length of lemma, hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. North America.
Country /Province /State. Western Canada, Northwest USA, Southwestern USA, Mexico. British Columbia. Oregon, Washington. California. Northwest Mexico.
Baja California Sur.

Agrostis montevidensis Spreng. ex Nees. *Agrost. Bras.* 403 (1829).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uruguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Uruguay, Montevideo: *Sellow* .

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (117), S.A.Renvoize, *Gramineas de Bolivia* (1998) (Fig. 42), L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (476, Fig. 102 & 477, Fig. 103), A.Burkat, *Flora Illustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (123, Fig. 39), A.L.Cabrera, *Flora de la Provincia de Buenos Aires, IV Pt 2 Gramineas* (1970) (228, Fig. 60), B.Rosengurt, *Gramineas Uruguayas I* (1970).

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Montevideo, Uruguay.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 20–80 cm long. Ligule an eciliate membrane, 1.5–3 mm long, erose. Leaf-blades 2–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, obovate, effuse, 10–30 cm long, 5–9 cm wide. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 10–45 mm long, smooth or scaberulous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.8–2.4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.8–2.4 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.8–2.4 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.66–0.75 way up back of lemma, straight, 2–2.5 mm long overall, without a column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.8 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Africa (*), South America.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Ferdinand Jacob Heinrich Mueller (1825–96) German-born Australian botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect, 20–30 cm long. Culm-nodes glabrous. Leaf-sheaths smooth or scaberulous. Ligule an eciliate membrane, 2–3 mm long, acute. Leaf-blades filiform or linear, conduplicate, 3–10 cm long, 1–3 mm wide.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle contracted, linear, 2–6 cm long. Primary panicle branches appressed. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Spikelet callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3–3.5 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.7–3.2 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 2.7–3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, muticous or mucronate or awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight, 1–1.5 mm long overall. Palea present or absent or minute, 0–0.33 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.6–0.8 mm long. Caryopsis with adherent pericarp, ellipsoid, 1.3 mm long.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia, New Zealand. New South Wales, Victoria, Tasmania. New Zealand North I, New Zealand South I.

Tablelands.

Agrostis munroana Aitch. & Hemsl. *Journ. Linn. Soc.* 19: 192 (1882).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from Pakistan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Pakistan, Shend Toi: *Aitchison 1252* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of William Munro (1818–1880) Scots-born British soldier and amateur botanist who collected extensively in India.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, 10–45(–70) cm long. Ligule an eciliate membrane, 2.5–4 mm long, obtuse. Leaf-blades 3–15 cm long, 1.5–5 mm wide. Leaf-blade surface smooth or scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, linear or oblong, dense or loose or effuse, 3–15(–20) cm long. Primary panicle branches 2–3 -nate. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.5–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose. Floret callus hairs 0.33 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.5–2.5 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.2–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface pilose. Lemma apex erose, truncate, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.4–0.5 way up back of lemma, straight, 1–3 mm long overall. Palea 1 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.4–0.8 mm long. Stigmas 2, laterally exerted. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

$n = 21$ (2 refs TROPICOS).

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. Western Asia, China. Afghanistan, Iran. China South Central, Tibet. **Indian Subcontinent.** India, Nepal, Pakistan, West Himalaya.

Yunnan. Uttah Pradesh. Himachal Pradesh, Jammu Kashmir.

Agrostis muscosa T. Kirk. *Trans. N. Z. Inst.* 13: 385. (1881).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from New Zealand. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New Zealand, Lake Wanaka: *Kirk* (WELT lecto).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. muscus*, moss; *-osa*, abundance. In habit resembling a moss.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, cushion forming. Basal innovations extravaginal. Culms 1–6 cm long. Leaf-sheaths smooth. Ligule an eciliate membrane, 0.5–1.5 mm long, scaberulous on abaxial surface, lacerate, truncate or acute. Leaf-blades spreading, curved, involute, 0.4–1.2 cm long, 0.2–0.4 mm wide. Leaf-blade surface ribbed, scabrous, rough adaxially. Leaf-blade margins scabrous. Leaf-blade apex obtuse.

Inflorescence. Inflorescence a panicle, shorter than basal leaves. Peduncle smooth. Panicle capitate, ovate, 0.3–0.7 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 1.5–2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 1.5–2 mm long, 1 length of upper glume, membranous, much thinner on margins, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.5–2 mm long, membranous, with hyaline margins, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.2–1.4 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure, extending close to apex. Lemma apex truncate, muticous. Palea 0.2–0.4 mm long, 0.2–0.25 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.2–0.3 mm long, membranous. Anthers 3, 0.4–0.6 mm long. Caryopsis with adherent pericarp, 0.7–1 mm long. Hilum linear.

$n = 21$ (1 ref TROPICOS). $2n = 42$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand North I, New Zealand South I, Stewart Is.

Agrostis musjidii S. Rajeswari R.R. Rao & Arti Garg. *J. Ind. Bot. Soc.*, 74: 333 (1995).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Kashmir, Musjid valley: Duthie 13267 (DD holo).

Illustrations: None found.

Classification. Subfamily Pooideae. Tribe: Poae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect, slender, 18 cm long. Culm-internodes distally glabrous. Lateral branches lacking. Ligule an eciliate membrane, 1–1.5 mm long, obtuse. Leaf-blades 5–7 cm long, 2 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 5–7 cm long. Primary panicle branches ascending. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, reaching apex of florets or exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume elliptic, 2 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth or asperulous. Lower glume apex acute. Upper glume elliptic, 2 mm long, 1–1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface smooth or asperulous. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.8–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface puberulous. Lemma apex erose, mucous.

Flower and Fruit. Anthers 3, 0.5–0.8 mm long.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.

Jammu Kashmir.

Agrostis myriantha Hook. f. *Fl. Brit. Ind.* 7: 257. (1896).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Khasia Hills: *Hooker* 7.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *myrios*, countless; *anthos*, flower. Inflorescence many spikelets.

Classification. Subfamily Pooideae. Tribe: Poae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, robust, 80–160 cm long. Ligule an eciliate membrane, 0.5 mm long. Leaf-blades 10–30 cm long, 3–10 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 15–30 cm long. Primary panicle branches not whorled or whorled at most nodes, naked below or bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, clavate, smooth.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2 mm long, breaking up at maturity, disarticulating below each fertile floret. Spikelet callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth or scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2 mm long, 1.6 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth or scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.25 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, mucous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.5 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. Indian Subcontinent, Indo-China. Assam, Eastern Himalaya, India, West Himalaya. Sikkim. Assam. Himachal Pradesh.

Agrostis nebulosa Boiss. & Reut. *Diagn.* 26. (1842).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Spain. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Spain, Madrid: *Reuter* .

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 24 Poaceae*, part 1 (2007) (660).

Derivation (Clifford & Bostock 2007): *L. nebula*, mist; *-osa*, abundance. Growing on high mountains.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, 25–50 cm long, 2–3 -noded. Culm-internodes smooth. Leaf-sheaths scaberulous, glabrous on surface. Ligule an eciliate membrane, 1.5–3.5 mm long, erose. Leaf-blades flat, 3–10 cm long, 1–3.5 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 12–20 cm long, 6–10 cm wide. Primary panicle branches 10–15 -nate, whorled at most nodes. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, clavate, 5–12 mm long, 4–7 length of fertile spikelet.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.3–1.7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.3–1.7 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume lanceolate, 1.3–1.7 mm long, 2–3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex obtuse.

Florets. Fertile lemma elliptic, 0.4–0.8 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, truncate, mucicous. Palea 0.4–0.6 mm long, 0.75–1 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear.

Derivation (Clifford & Bostock 2007): *L. nervus*, nerve; *-osa*, abundance. With conspicuous nerves in the glumes or lemmas.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, 20–45 cm long, 2–3-noded. Culm-nodes brown. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 1–2 mm long. Leaf-blades 6–8 cm long, 1–2 mm wide. Leaf-blade surface scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or pyramidal, 3–12 cm long, 0.5–6 cm wide. Primary panicle branches whorled at lower nodes. Panicle branches capillary, smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–3 mm long, smooth or scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2.7–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous or pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume elliptic or oblong, 2.7–3.5 mm long, 1 length of upper glume, membranous, mid-green or purple, 1-keeled, 1-veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute or acuminate. Upper glume lanceolate or elliptic, 2.6–3.15 mm long, 1.3–1.7 length of adjacent fertile lemma, membranous, mid-green or purple, 1-keeled, 1-veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong or ovate, 1.5–2.4 mm long, hyaline, without keel, 5-veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma surface scaberulous. Lemma apex erose, truncate, mucous. Palea 0.5–0.8 mm long, 0.33 length of lemma, hyaline, 0-veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

TYPE from Spain. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Spain, Sierra Nevada: Coll?.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Sierra Nevada, Spain.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 6–60 cm long. Culm-internodes antrorsely scabrous. Leaf-sheaths without keel, smooth or scaberulous, glabrous on surface. Ligule an eciliate membrane, 4–6 mm long, entire or lacerate. Leaf-blades filiform, 5–15 cm long, 0.5–0.8 mm wide. Leaf-blade surface scabrous, rough on both sides. Leaf-blade apex obtuse or abruptly acute.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 5–10 cm long. Primary panicle branches ascending or spreading, whorled at most nodes. Panicle axis scabrous. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous, tip rectangular.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.4 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2–2.5 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 1-veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–2.5 mm long, 1.2 length of adjacent fertile lemma, membranous, purple, 1-

keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.8 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 3–3.5 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.2 mm long, yellow. Caryopsis with adherent pericarp, oblong, sulcate on hilar side, 1.4–1.5 mm long, light brown. Embryo 0.25–0.33 length of caryopsis. Hilum elliptic.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Sergei Arseniyevich Nevsky (1908–1938) Russian agrostologist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 15–40 cm long. Culm-internodes smooth. Culm-nodes black. Lateral branches lacking. Ligule an eciliate membrane, 0.7–1.5 mm long, obtuse. Leaf-blades 1–1.5 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 4–7 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose. Floret callus hairs 0.3–0.4 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume oblong, 2 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume oblong, 2 mm long, 1.1 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.8–1.9 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 2–2.5 mm long overall, with twisted column. Palea 0.5–0.66 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.7 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. **Middle Asia.** Turkmenistan.

Agrostis nipponensis Honda. *Bot. Mag., Tokyo* 41: 380. (1927).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

TYPE from Japan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Japan, Mito: *Ando* ; Japan, Otsu: *Hashimoto* ; Japan, Myuga: *Mayebara* 187 ; Japan, Myuga: *Mayebara* 194 .

Illustrations (Books): T.Koyama, *Grasses of Japan and its neighbouring regions* (1987) (198, Fig. 69).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Nippon, that is, Japan.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent. Culms 40–70 cm long, 1.5–2.2 mm diam., 3–4 -noded. Leaves basal and cauline. Ligule an eciliate membrane, 1–3 mm long, truncate. Leaf-blades 7–17 cm long, 3–5 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 10–25 cm long, 5–7 cm wide. Primary panicle branches 3–7 -nate. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.3–3.6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, shorter than spikelet, firmer than fertile lemma. Lower glume lanceolate, 3 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3 mm long, 0.8–0.9 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume apex acute.

Florets. Fertile lemma ovate, 3.3–3.6 mm long, hyaline, without keel, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma apex obtuse, mucicous. Palea 0.15 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.7–1 mm long. Caryopsis with adherent pericarp, obovoid, 1.5 mm long. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Japan Honshu, or Shikoku, or Kyushu. Japan.

Agrostis novogaliciana R. McVaugh. *Fl. Novo-Galiciana* 14: 41 (1983).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mexico, Sierra de Manantlan: McVaugh 23123 (MICH holo, NY, US).

Illustrations (Books): R.McVaugh, *Flora Nova-Galiciana* Vol.14 *Gramineae* (1983).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating location. From Novo Galicia, that is New Mexico.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Butt sheaths persistent and investing base of culm. Culms erect, 60–75 cm long. Ligule an eciliate membrane, 3–6 mm long. Leaf-blades involute, 12–25 cm long, 2–4 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, obovate, 15 cm long. Primary panicle branches ascending, 2–3 -nate, 5–8 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 3–5 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, with lower narrower than upper, exceeding apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume elliptic, 3 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth. Lower glume lateral veins absent. Lower glume apex acute. Upper glume elliptic, 3 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 3 mm long, cartilaginous, without keel. Lemma apex obtuse, mucicous. Palea 1 length of lemma, hyaline. Rhachilla extension 0.5 mm long.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.7–2 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Southwest Mexico.

Jalisco.

Agrostis obtusissima Hack. *Oesterr. Bot. Zeitschr.* 1902, 107. (1902).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madeira. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madeira, Pico dos Arrieros: Mandon 273 (K iso).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. obtusus*, blunt; *-issima*, most. Glume apices rounded.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 15–25 cm long. Culm-internodes smooth, distally glabrous. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths longer than adjacent culm internode, smooth, glabrous on surface. Ligule an eciliate membrane, erose. Leaf-blades 6–12 cm long, 1–2.5 mm wide, flaccid. Leaf-blade surface glabrous. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 6–13 cm long, with spikelets clustered towards branch tips. Primary panicle branches 2–3 -nate. Panicle branches capillary, glabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, clavate.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus sparsely hairy.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2–2.5 mm long, 1 length of upper glume, membranous, without keels, 1 -veined. Lower glume primary vein smooth. Lower glume lateral veins absent. Lower glume apex erose, truncate. Upper glume lanceolate, 2–2.5 mm long, 2 length of adjacent fertile lemma, membranous, without keels, 3 -veined. Upper glume primary vein scaberulous. Upper glume apex erose, truncate.

Florets. Fertile lemma ovate, 1–1.2 mm long, hyaline, without keel, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma lateral veins excurrent. Lemma apex erose, truncate, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight, 0.5 mm long overall. Palea 0.5 length of lemma, hyaline, 2 -veined. Palea apex obtuse.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.2 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Macaronesia. Madeira.

Agrostis olympica (Boiss.) Bor. *Arbok Univ. Berg., Mat. Nat.* No. 2, 4 (1961).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Turkey. **Basionym or Replaced Name:** *Calamagrostis olympica* Boiss., *Diagn. Ser.* (1) 5: 70 (1844). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Turkey, Olympi Bythyni: Boissier (G holo, K).

Recent Synonyms: *Agrostis agrostidiformis* (Roshev.) Bor, *Arbok Univ. Berg., Mat.-Nat.*, No. 18, 34 (1964).

Illustrations (Books): N.L.Bor, *Gramineae* in K.H.Rechinger, *Flora Iranica*. No. 70/30 (1970) (Tab. 45), N.L.Bor, *Gramineae* in *Flora of Iraq* (1968) (288, Pl. 101).

Derivation (Clifford & Bostock 2007): *L. ica*, belonging to. From Mt Olympus, north-west Turkey.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 4–20 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1.7–2 mm long. Leaf-blades filiform, 1–8 cm long, 0.6–2.4 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade margins scabrous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle open, linear or lanceolate, dense, 1–4 cm long, 0.2–0.8 cm wide. Primary panicle branches ascending, 0.8–1.5 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 0.3–2 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.5–2.3 mm long, breaking up at

maturity, disarticulating below each fertile floret. Floret callus bearded. Floret callus hairs 1 length of lemma.

Glumes. Glumes persistent, similar, reaching apex of florets or exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume ovate, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume ovate, 1.5–2.3 mm long, 1–1.1 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.5–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface pilose. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 2–4 mm long overall, with twisted column. Palea 1 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.3–0.5 mm long. Stigmas 2, laterally exerted. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Middle Asia, Caucasus, Western Asia. Kazakhstan, Turkmenistan. Iran, Iraq.

Agrostis oregonensis Vasey. *Bull. Torrey Bot. Club* 13: 56. (1886).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: USA, Oregon, Mt. Hood: Howell (US holo, K, LE).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (650).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Oregon State, USA.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–80 cm long. Lateral branches lacking. Ligule an eciliate membrane, 2–4 mm long, erose or lacerate, obtuse or acute. Leaf-blades 2–4 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 10–30 cm long. Primary panicle branches ascending or spreading, whorled at most nodes, 5–10 cm long. Panicle branches stiff. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.2–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 2.2–3 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.2–3 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex muticous. Palea 0.2 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.3 mm long, membranous. Anthers 3, 0.4–0.6 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA, Southwestern USA. Idaho, Montana, Oregon, Washington, Wyoming. California, Nevada.

Agrostis oresbia E. Edgar. *New Zealand J. Bot.* 29(2): 143 (1991).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from New Zealand. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New Zealand, Tararua Ra: *Druce* (CHR holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk *oresbios*, mountain dweller. Alpine or subalpine species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Stolons absent or present. Basal innovations intravaginal. Culms 5–25 cm long. Leaf-sheaths smooth. Ligule an eciliate membrane, 1–4.5 mm long, glabrous on abaxial surface, entire or erose, truncate or obtuse. Leaf-blades flat or conduplicate, 2–7 cm long, 1.5–2 mm wide. Leaf-blade surface smooth or scaberulous, rough adaxially. Leaf-blade margins smooth or scaberulous. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence a panicle. Peduncle smooth. Panicle open, oblong or pyramidal, 2–6 cm long. Primary panicle branches spreading. Panicle branches smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, smooth or scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 2–2.5 mm long, 1–1.2 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute or acuminate. Upper glume lanceolate, 1.7–2.5 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma ovate, 1.5–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure, extending close to apex. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight or geniculate, 2–3 mm long overall, without a column or with twisted column. Palea 0.5 mm long, 0.25–0.33 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.3 mm long, membranous. Anthers 3, 0.6–0.9 mm long. Caryopsis with adherent pericarp, 1.5 mm long. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand North I, New Zealand South I.

Agrostis pallens Trin. *Mem. Acad. Petersb. Ser. 6*, 4(3–4) 328. (1845).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Canada. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Canada: Hooker (LE holo).

Recent Synonyms: *Agrostis diegoensis* Vasey, *Bull. Torrey Bot. Club* 13: 55. (1886). *Agrostis lepida* Hitchcock, Jepson, *Fl. Calif.* i. 121 (1912).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 24 Poaceae*, part 1 (2007) (652).

Derivation (Clifford & Bostock 2007): *L. pale*. Inflorescences pale.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated, wiry. Culms erect, 15–30 cm long. Ligule an eciliate membrane, 1–3 mm long, entire or erose, obtuse. Leaf-blades involute, 10–20 cm long, 1.5–3 mm wide. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted or spiciform, lanceolate, 3–10 cm long, 1–1.5 cm wide. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.2–0.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2.4–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex truncate, muticous. Palea absent or minute.

Flower and Fruit. Lodicules 2, 0.3–0.4 mm long, membranous. Anthers 3, 1.5 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. North America.

Country /Province /State. Western Canada, Northwest USA, Southwestern USA, Mexico. British Columbia, Idaho, Montana, Oregon, Washington. California, Nevada. Northwest Mexico. Baja California.

Agrostis pallescens Cheeseman. *Trans. N. Z. Inst.* 1921, 53: 423. (1921).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from New Zealand. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: : Based on *A. muelleri* var. *paludosa* ; New Zealand, Mt. Cook: Cheeseman (W lecto).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. pallesco*, become pale. Losing color at maturity, especially spikelets.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Basal innovations extravaginal. Culms erect, 3–5 cm long. Ligule an eciliate membrane, 0.1–0.6 mm long, glabrous on abaxial surface, erose, truncate. Leaf-blades filiform, involute, 0.5–2.5 cm long, 0.2–0.4 mm wide. Leaf-blade surface scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Peduncle smooth. Panicle open, ovate or pyramidal, 0.6–2 cm long, bearing few spikelets. Primary panicle branches bearing 1 fertile spikelets on each lower branch. Panicle branches puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 1.5–2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, reaching apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 1.2–1.8 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume lanceolate, 1.2–1.8 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex obtuse.

Florets. Fertile lemma ovate, 1.2–1.8 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure, extending close to apex. Lemma apex truncate or obtuse, muticous. Palea 0.4–0.6 mm long, 0.33 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.2–0.4 mm long, membranous. Anthers 3, 0.4–0.7 mm long. Caryopsis with adherent pericarp, 1 mm long. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand North I, New Zealand South I, Stewart Is.

Agrostis parviflora Roth. *Tent. Fl. Germ.* 1: 31 (1788).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Nelson s.n.*, Feb 1792, Australia: Tasmania: Adventure Bay (BM).

Illustrations (Books): N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (473, Fig. 92), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (110), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (168, Fig. 25).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): *L. parvus*, small; *flos*, flower. Spikelets small or with few florets.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Culms erect or geniculately ascending, weak, 15–35 cm long, 2-noded. Culm-nodes glabrous. Leaves mostly basal. Leaf-sheaths loose. Ligule an eciliate membrane, 1–2 mm long, obtuse. Leaf-blades involute, 1–10 cm long, 0.25–1 mm wide. Leaf-blade surface smooth. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 3–9 cm long, 2–7 cm wide, bearing few spikelets. Primary panicle branches 1–3-nate. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 1.5–2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, keeled above, 1-veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, keeled above, 1-veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 1.3–1.8 mm long, hyaline, without keel, 5-veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex truncate, mucous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.3–0.4 mm long. Caryopsis with adherent pericarp, ellipsoid. Hilum linear.

n = 21 (1 ref TROPICOS).

Distribution (TDWG). Continent. Europe, Australasia.

Region. Northern Europe (*).

Country /Province /State. : GB Aliens (Ryves et al). **Australia.** New South Wales, A.C.T., Tasmania, Victoria.

Tablelands.

Agrostis paulsenii Hack. ex Paulsen. *Kjoeb. Vidensk. Meddel.* 1903, 165. (1903).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Pamir, Djangalik: *Paulsen 1266* (LE iso).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Ove Vilhelm Paulsen (1874–1947) Danish botanist and traveller.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 25–50 cm long. Culm-internodes smooth. Lateral branches lacking. Ligule an eciliate membrane, 3–4 mm long. Leaf-blades 7–15 cm long, 3–5 mm wide, flaccid. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 9–18 cm long, 2–4 cm wide. Primary panicle branches 3–5-nate, bearing spikelets almost to the base. Panicle branches capillary, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.8–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.8–2.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.8–2.5 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.7–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, curved, 1.5–3 mm long overall. Palea 0.75 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.7–1.2 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Middle Asia, Western Asia. Turkmenistan. Iran.

Agrostis peninsularis Hook. f. *Fl. Brit. Ind.* 7: 255. (1896).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India: *Wight 1746*.

Illustrations (Books): K.M.Matthew, *Flora Palni Hills* (1996) (778, Pl. 778).

Derivation (Clifford & Bostock 2007): L. -aris, pertaining to. From peninsula India.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect, 20–80 cm long. Culm-nodes glabrous. Ligule an eciliate membrane, 1–3 mm long, truncate. Leaf-blades linear or lanceolate, 3–15 cm long, 1–5 mm wide, mid-green or glaucous. Leaf-blade apex acute or acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 5–20 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3–4 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3–4 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.5–3 mm long, 1.3–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2–3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 4–6 mm long overall, with twisted column. Palea 2–2.5 mm long, 0.9–1 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.5–1.25 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.

Kerala. Tamilnadu.

Agrostis perennans (Walter) Tuckerm. *Am. Journ. Sc. Arts* 45:44. (1843).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Cornucopiae altissimum* Walt., *Fl. Carol.* 74 (1788). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: USA, South Carolina: Walter.

Recent Synonyms: *Agrostis flavidula* Steud., *Syn. Pl. Gram.* 421. (1854). *Agrostis altissima* (Walter) Tuckerm., *Am. Journ. Sc.* 45: 44 (1843).

Agrostis elata (Pursh.) Trin., *Mem. Acad. Petersb. Ser.* 6, 4(3–4): 317 (1841).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (118), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (650), F.W.Gould, *The Grasses of Texas* (1975) (143, Fig. 71), S.A.Renvoize, *Gramineas de Bolivia* (1998) (178, Fig. 42), W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (33, Fig. 5), M.N.Correa, *Flora Patagonica* Parte III, Gramineae (1978) (382, Fig. 257 as *A. flavidula*).

Derivation (Clifford & Bostock 2007): *L. perenno*, persist for several years. Perennials.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms decumbent, weak, 50–100 cm long, 0.7–1 mm diam. Lateral branches lacking. Leaves cauline. Leaf-sheaths ribbed, smooth, glabrous on surface. Ligule an eciliate membrane, 2–5 mm long, lacerate. Leaf-blades 6–13 cm long, 1.5–3 mm wide. Leaf-blade surface ribbed, scaberulous.

Inflorescence. Inflorescence a panicle. Peduncle 8–15 cm long. Panicle open, ovate, effuse, 11–15 cm long, 6–11 cm wide. Primary panicle branches 3–7-nate, whorled at most nodes. Panicle branches flexuous. Spikelets spreading, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 2.2–2.9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume oblong, 2.2–2.9 mm long, 1.1–1.2 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex caudate. Upper glume oblong, 1.9–2.3 mm long, 1.1–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex caudate.

Florets. Fertile lemma ovate, 1.7–1.8 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure, extending close to apex. Lemma apex erose, truncate, muticous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.8–1 mm long, purple. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Africa, North America, South America.

Country /Province /State. **Western Indian Ocean.** Madagascar (*). **Eastern Canada, North-central USA, Northeast USA, South-central USA, Southeastern USA, Mexico.** Newfoundland, Nova Scotia, Ontario, Quebec. Agrostis personata E. Edgar. *New Zealand J. Bot.* 29(2): 149 (1991).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from New Zealand. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: : Based on *A. dyeri* var. *delicatior*; New Zealand, Lake Te Anau: Petrie (W lecto).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. masked*, that is, resembling something else. Readily confused with another species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Basal innovations extravaginal. Culms geniculately ascending, 6.5–30 cm long. Leaf-sheaths smooth. Ligule an eciliate

membrane, 0.8–2 mm long, scaberulous on abaxial surface, erose, truncate or obtuse. Leaf-blades flat or conduplicate or involute, 2–8 cm long, 0.5–1.5 mm wide, flaccid. Leaf-blade surface scabrous, rough adaxially or on both sides. Leaf-blade margins smooth or scaberulous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Peduncle smooth. Panicle open, lanceolate or pyramidal, 4.5–8.5 cm long. Primary panicle branches spreading. Panicle axis scaberulous. Panicle branches capillary, with occasional prickles. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 2–3.5 mm long, 1 length of upper glume, membranous, much thinner on margins, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–3.5 mm long, membranous, with hyaline margins, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.4–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex entire or erose, truncate, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.5–0.66 way up back of lemma, straight, 1–3 mm long overall. Palea 0.3–0.6 mm long, 0.25 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.3–0.6 mm long, membranous. Anthers 3, 0.4–0.7 mm long. Caryopsis with adherent pericarp, 1–1.5 mm long. Hilum linear.

$2n = 42$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand North I, New Zealand South I, Stewart Is.

Agrostis petriei Hack. *Trans. Proc. N.Z Inst.* 5: 379. (1903).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from New Zealand. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New Zealand, Hector Mts.: Petrie (W holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Donald Petrie (1846–1925) Scots-born New Zealand educationalist and amateur botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 30–55 cm long. Leaf-sheaths smooth or scaberulous. Ligule an eciliate membrane, 1–4.5 mm long, scaberulous on abaxial surface, erose, truncate or obtuse. Leaf-blades filiform, involute, 4–10.5 cm long, 0.3–1 mm wide, stiff. Leaf-blade surface scabrous, rough abaxially. Leaf-blade apex obtuse.

Inflorescence. Inflorescence a panicle. Peduncle smooth. Panicle open, oblong, 4–16 cm long. Primary panicle branches spreading. Panicle axis smooth. Panicle branches capillary, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2.5–3.4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 2.5–3.4 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.5–3.4 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 2–2.6 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, truncate or obtuse, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight, 2–3 mm long overall. Palea 0.2–0.4 mm long, 0.1–0.15 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.2–0.4 mm long, membranous. Anthers 3, 1.3–1.7 mm long. Caryopsis with adherent pericarp, 1.5 mm long. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand South I.

Agrostis philippiana Z.E.R. Agrasar & M.E. De Paula. *Fl. Patagonica* 3: 379 (1978).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: : Based on A. clausa Phil. ; Chile, Patagonia, Rio Aysen: Simpson (SGO holo).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (119), M.N.Correa, *Flora Patagonica* Parte III, Gramineae (1978) (*Fl. Pat.* 3: 377, Fig. 250 (1978)).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Rudolf Amandus Philippi (1808–1904) German-born Chilean biologist and museum director.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent or short. Culms 35–45 cm long. Leaf-sheaths tight, 2–9 cm long, smooth. Ligule an eciliate membrane, 1.5–2 mm long, truncate. Leaf-blades 2–6 cm long, 1–2 mm wide, stiff. Leaf-blade surface smooth or scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, 3–11 cm long, 2–8 cm wide. Primary panicle branches 2–3 -nate, whorled at lower nodes. Panicle axis smooth. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.1–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous or sparsely hairy.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.1–2.5 mm long, 1.3–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.6–1.7 mm long, hyaline, without keel, 3 -veined, 0–3 -veined. Lemma apex truncate, mucronate. Principal lemma awn subapical. Palea 1–1.2 mm long, hyaline.

Flower and Fruit. Lodicules 2, 0.6 mm long, membranous. Anthers 3, 1.2 mm long. Caryopsis with adherent pericarp, 1.3 mm long. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina South, Chile Central, Chile South.

Chubut, Neuquén, Río Negro, Santa Cruz. Rest of Chile- Biobio, La Auracania, Maule, O'Higgins, Santado, Valpariso. Maule. Los Lagos, Aisen, Magellanes.

Agrostis pilgeriana C. E. Hubbard. *Kew Bull.* 1936, 302. (1936).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Kenya. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Kenya, Mt. Kenya: *Fries 1342* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Robert Knuds Friedrich Pilger (1876–1953) German agrostologist, born on Helgoland before its transfer from British to German administration.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Stolons present. Culms decumbent, 7–100 cm long. Ligule an eciliate membrane, 4 mm long. Leaf-blades flat, 5–14 cm long, 1–3 mm wide. Leaf-blade surface smooth or scaberulous, glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear or oblong, loose or effuse, 10–20 cm long. Primary panicle branches ascending or spreading, 2–3 -nate. Panicle branches capillary, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 0.5–2 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 2.5–3 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acute. Upper glume lanceolate, 2.2–2.8 mm long, 1.5–1.8 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.7 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy below. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.6–0.7 way up back of lemma, straight, 2–4 mm long overall, with a straight or slightly twisted column. Palea 0.9 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.6 mm long. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, East Tropical Africa. Rwanda. Kenya.

Agrostis pilosa Schleich. ex Gaud., non Retz.(1791). *Agrost. Helv.* 1: 75 (1811).

Accepted by: N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960).

TYPE from Switzerland. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Switzerland, Panerossaz: Schleicher.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. pilus*, a hair; *-osa*, abundance. The whole plant or any of its organs invested with long spreading hairs.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Basal innovations intravaginal. Culms 30–90 cm long. Leaf-sheaths smooth or scaberulous. Ligule an eciliate membrane, 1.3–6 mm long, scaberulous on abaxial surface, erose, obtuse. Leaf-blades 6–28 cm long, 2–6.5 mm wide. Leaf-blade surface ribbed, scaberulous, rough on both sides. Leaf-blade margins scaberulous, glabrous.

Inflorescence. Inflorescence a panicle, deciduous as a whole. Panicle open, elliptic or ovate, 12–28 cm long, 6–20 cm wide. Panicle axis scabrous. Panicle branches capillary, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension or with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3.5–5.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded. Floret callus hairs 1.5 mm long, 0.5 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate or elliptic, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface smooth or asperulous, rough above. Lower glume apex acute or acuminate. Upper glume linear or lanceolate, 3.5–5.5 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface smooth or asperulous, rough above. Upper glume apex acute or acuminate.

Florets. Fertile lemma elliptic or oblong, 2–2.8 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface pilose, hairy below. Lemma apex truncate, awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight or geniculate, 1–8.5 mm long overall, with a straight or slightly twisted column. Palea elliptic or oblong, 0.5–1 length of lemma, hyaline, 2 -veined. Rhachilla extension 0.2–0.5 mm long, pilose, with 1 mm long hairs.

Flower and Fruit. Lodicules 2, lanceolate, 0.5 mm long, membranous, acute. Anthers 3, 0.6–1.2 mm long. Caryopsis with adherent pericarp, 1.3–1.8 mm long.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand South I.

Agrostis pilosula Trin. *Mem. Acad. Petersb. Ser. 6*, 4(3–4) 372. (1845).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from India. **Basionym or Replaced Name:** *Agrostis royleana* Trin., *Mem. Acad. Petersb. Ser. 6* (6) 2: 371 (1841). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Huttoo: Royle 72 (LE holo).

Recent Synonyms: *Calamagrostis ciliata* Steud., *Syn. Pl. Gram.* 193 (1854). *Lachnagrostis scabra* Nees ex Trin., *Mem. Acad. Imp. Sci. Saint-Petersbourg, Ser. 6, Sci. Math., Seconde Pt. Sci. Nat.* 6,4(3–4): 372 (1841)

Illustrations (Books): K.M.Matthew, *Flora Palni Hills* (1996) (779, Pl. 779), H.J.Noltie, *The Grasses of Bhutan* (2000) (605, Fig. 26), J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (as *Lachnagrostis scabra*), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 458).

Derivation (Clifford & Bostock 2007): *L. pilus*, a hair; *-osa*, abundance. *-ula*, diminutive.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, 30–75 cm long, without nodal roots or rooting from lower nodes. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 4–6 mm long. Leaf-blades 15–30 cm long, 2–3 mm wide. Leaf-blade surface scaberulous, rough on both sides, glabrous or pubescent, sparsely hairy, hairy adaxially. Leaf-blade margins scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, lanceolate or ovate, dense or loose or effuse, (5–)10–30 cm long. Primary panicle branches 2–5-nate, whorled at most nodes. Panicle branches flexuous, smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, smooth, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–5.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2.7–5.5 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1-veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–5 mm long, 1.3–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1-veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5–3.5 mm long, hyaline, without keel, 5-veined, more than 3-veined. Lemma lateral veins excurrent or extending close to apex. Lemma surface pubescent. Lemma apex truncate, awned, 1-awned. Principal lemma awn dorsal, arising 0.25–0.33 way up back of lemma, geniculate, 4–6 mm long overall, with twisted column. Palea 0.25–0.33 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.75–1.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

n = 21 (2 refs TROPICOS).

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. Western Asia, China. Iran. China South Central, Qinghai. **Indian Subcontinent, Indo-China.** Eastern Himalaya, India, Nepal, Pakistan, Sri Lanka, West Himalaya. Sichuan, Yunnan. Darjeeling, Bhutan, Sikkim. Punjab, Tamilnadu, Uttah Pradesh. Himachal Pradesh.

Agrostis pittieri Hack. *Oesterr. Bot. Zeitschr.* 52(2) :60.1902.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Costa Rica. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Costa Rica, Potero del Alto: Pittier 2985 (W syn, US) ; Costa Rica, Potero del Alto: Pittier 334 (W syn, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Henry Francois de Fabrega Pittier (1857–1950) Swiss botanist and civil engineer.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations intravaginal. Culms 30–60 cm long, 0.5–1 mm diam., 3 -noded. Culm-nodes purple. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths smooth or scaberulous, glabrous on surface. Ligule an eciliate membrane, 2.5–3.5 mm long. Leaf-blades filiform, conduplicate, 7–15 cm long, 0.6–1 mm wide. Leaf-blade surface ribbed, scaberulous, rough abaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 9–11 cm long, 0.5–1 cm wide. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 1–2 length of fertile spikelet, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.9–3.9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume oblong, 2.9–3.9 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume oblong, 2.8–3.4 mm long, 1.5–1.7 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.9–2 mm long, hyaline, without keel. Lemma lateral veins obscure, extending close to apex. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight, 2–3 mm long overall, without a column. Palea 0.7–1.1 mm long, 0.33–0.5 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.2–1.5 mm long, purple. Caryopsis with adherent pericarp. Hilum linear.

$2n = 42$ (1 ref TROPICOS).

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Costa Rica.

Agrostis platensis L. Parodi. *Rev. Argent. Agron.* 18: 143 (1951).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *L.R. Parodi 4793*, 15 Dec 1922, Argentina: Buenos Aires: Distrito Federal: Belgrano (BAA; IT: SI, US-1160948, US-997292).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina 3 – 2 Pooideae* (2012) (120), A.L.Cabrera, *Flora de la Provincia de Buenos Aires, IV Pt 2 Gramineas* (1970) (226, Fig. 59).

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From La Plata Province, Argentina, or Platte River between Uruguay and Argentina.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Basal innovations extravaginal. Culms decumbent, 70–150 cm long, rooting from lower nodes. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 4–8 mm long, lacerate. Leaf-blades 10–25 cm long, 4–8 mm wide, flaccid. Leaf-blade surface glabrous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or oblong, 12–25 cm long, 1–3 cm wide. Primary panicle branches appressed, 2–6 -nate, 2–5 cm long. Panicle axis smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1 length of fertile spikelet, scabrous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acuminate, awned, 1 -awned, awn 0.5–1 mm long. Upper glume lanceolate, 3 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acuminate, awned, 1 -awned, awn 0.5–1 mm long.

Florets. Fertile lemma ovate, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33 way up back of lemma, straight, 1–2 mm long overall, not or scarcely exerted from spikelet. Palea 0.8 mm long, hyaline, 0 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.8 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil South. Argentina Northeast. Rio Grande do Sul. Buenos Aires.

Agrostis polypogonoides Stapf. *Fl. Cap.* 7: 549 (1899).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Polylogon*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Coast Region: Cape Div.; Muizenburg Vlei, *Wolley Cod 2349*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Resembling *Polylogon* with respect to the inflorescence.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–75 cm long. Ligule an eciliate membrane. Leaf-blades 6–12 cm long, 3–4 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or elliptic, 10–16 cm long, contracted about primary branches. Primary panicle branches bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform or linear, 0.5–2 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 4–5 mm long, falling entire, deciduous with the pedicel. Floret callus pubescent.

Glumes. Glumes similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 4–5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acuminate, awned, 1 -awned, awn 1–3 mm long. Upper glume lanceolate, 4–5 mm long, 2–2.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acuminate, awned, 1 -awned, awn 1–3 mm long.

Florets. Fertile lemma oblong, 2 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 3 mm long overall, with twisted column. Palea 1 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.5 mm long. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Northern Cape, Western Cape.

Agrostis producta Pilger. *Engl. Jahrb.* 9: 600 (1907).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Kenya, Tanzania. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mau plateau: *F.D. 14* (B syn, EA); Tanzania, Kilimanjaro: *Volkens 1156* (B syn).

Illustrations (Books): R.M.Pohill, F.T.E.A., *Gramineae* (1(1970):109, Fig.36), G.V.Pope et al., *Flora Zambesiaca* 10 (1(1970):109, Fig. 36).

Derivation (Clifford & Bostock 2007): *L. produco*, extend. Rhachilla drawn out.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Culms erect, 30–80 cm long, 2–4 -noded. Ligule an eciliate membrane. Leaf-blades flat or involute (rarely), 3–25 cm long, 1–3 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, oblong or ovate, dense or loose, 5–20 cm long. Panicle branches flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3.5–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 3.5–4.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acuminate. Upper glume lanceolate, 3.5–4.5 mm long, 1.7–1.8 length of adjacent fertile lemma, membranous, 1-keeled, 1–3 -veined. Upper glume primary vein scaberulous. Upper glume surface asperulous. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface pilose. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1–0.25 way up back of lemma, geniculate, 4–7 mm long overall, with twisted column. Palea 1 length of lemma, hyaline, 2 -veined. Palea apex with excurrent keel veins. Rhachilla extension 0.3–0.7 length of fertile floret (1–3mm), pilose, hairy below.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa. DRC. Sudan. Kenya, Tanzania, Uganda. Malawi, Zambia, Zimbabwe.

Agrostis propinqua S.W.L.Jacobs. *Telopea* 9(3): 681 (2002).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New South Wales: Southern Tablelands: Diggers Creek Valley, Snowy R. Hydro-Electric Authority, growing on dry mineral soil of road embankment, 1954, *M. Mueller 1900* (HT: NSW-506463).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (110).

Derivation (Clifford & Bostock 2007): *L. near to*. Similar to another species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Rhizomes absent or short. Culms erect or geniculately ascending, slender, 40–80 cm long, 4 -noded. Leaf-sheaths smooth or scaberulous. Ligule an eciliate membrane, 2–5 mm long, erose. Leaf-blades flat or involute, 1.5–4 mm wide. Leaf-blade surface ribbed, grooved adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or ovate, 10–35 cm long, with spikelets clustered towards branch tips. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.8–2 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 1.8–2 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 1 -

veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.8–2 mm long, 1–1.4 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma oblong, 1.25–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex emarginate or truncate, muticous. Palea absent or minute.

Flower and Fruit. Anthers 3, 0.3–0.5 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, A.C.T., Victoria. Tablelands.

Agrostis pubicallis Keng ex Y.C. Yang. *Bull. Bot. Res. North-East. Forest. Inst.*, 4(4): 101 (1984).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Sichuan: Kangding Xian, 3700–4600 m, 29 Aug. 1934, C.S. Liu 1429 (HT: ?).

Illustrations: None found.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect, 30 cm long, 0.5–0.7 mm diam., 3–4 -noded. Culm-internodes smooth. Leaves cauline. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 2–5 mm long, lacerate, obtuse. Leaf-blades flat or involute, 7–9 cm long, 1.5 mm wide. Leaf-blade surface scaberulous. Leaf-blade margins scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 7–12 cm long, 3–8 cm wide. Primary panicle branches spreading, 2 -nate. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.5–4.4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3.5–4.4 mm long, 1.1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 3.5–4.4 mm long, membranous, purple, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, 2.3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 4–5 mm long overall, with twisted column. Palea 0–0.2 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp, oblong, 1.7–1.8 mm long. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central. Sichuan.

Agrostis quinqueseta (Steud.) Hochst. *Flora* 38:285 (1855).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Ethiopia. **Basionym or Replaced Name:** *Anomalotis quinqueseta* Steud., *Syn. Pl. Gram.* 198 (1854). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *G.H.W. Schimper s.n.*, 1850, Ethiopia (P; IT: US-75397 (fragm. ex P)).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (48, Fig. 22).

Derivation (Clifford & Bostock 2007): *L. quinque*, five; *seta*, bristle. Lemma five-awned.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes short. Culms erect, 15–70 cm long. Ligule an eciliate membrane. Leaf-blades 4–25 cm long, 2–4 mm wide, stiff. Leaf-blade surface glabrous or pilose, sparsely hairy.

Inflorescence. Inflorescence a panicle. Panicle contracted or spiciform, linear, 4–25 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension or with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume ovate, 3–4.5 mm long, 1.1–1.2 length of upper glume, membranous, 1-keeled, 1–3 -veined. Lower glume primary vein scaberulous. Lower glume surface smooth. Lower glume apex acute. Upper glume lanceolate, 2.5–4 mm long, 1.2–1.6 length of adjacent fertile lemma, membranous, 1-keeled, 1–3 -veined. Upper glume primary vein scaberulous. Upper glume surface smooth. Upper glume apex acute.

Florets. Fertile lemma ovate, 2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface glabrous or pubescent. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 3.5–5 mm long overall, with twisted column. Palea 0.6–0.7 length of lemma, hyaline, 2 -veined. Rhachilla extension 0–0.2 length of fertile floret, pilose.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

$2n = 28$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa. Cameroon, Rwanda, DRC. Ethiopia (inc. Eritrea). Kenya, Uganda.

Agrostis reuteri Boiss. *Voy. Espagne*, 2: 645. (1845).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980).

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: : Based on *A. capillaris* Desf. In *eriosis et arenosis regionis calidae et montanae*, in provincia Malacitana Prolongo, prope Estepona Haenseler,.

Illustrations: None found.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending, 35–70 cm long, 3–5 -noded. Culm-internodes smooth. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 2.5–4.5 mm long, lacerate, obtuse. Leaf-blades flat, 5–17 cm long, 1–2.5 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic or ovate, effuse, 10–20 cm long, 2–8 cm wide. Primary panicle branches 2–6 -nate, whorled at most nodes. Panicle axis scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–7 mm long, 1.1–1.4 length of fertile spikelet.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.4–1.8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.4–1.8 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.4–1.8 mm long, 1.4–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 0.9–1.3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, truncate, mucicous. Palea 0.7–0.8 mm long, 0.6–0.75 length of lemma, hyaline. Palea apex erose.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.9–1.2 mm long. Caryopsis with adherent pericarp, 1 mm long. Hilum linear.

Distribution (TDWG). Continent. Europe, Africa, and South America.

Region. Southwestern Europe.

Country /Province /State. : Spain. **Northern Africa** and **Macaronesia**. Algeria, Morocco, Tunisia. Azores. **Southern South America**.

Agrostis rigidula Steud. *Syn. Pl. Gram.* 171. [Aug.] (1854).

Accepted by: T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

TYPE from Indonesia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Java: Zollinger 2589 .

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. rigidus*, stiff; *-ula*, diminutive. Plant with stiffly erect inflorescence branches or leaf-blades.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes absent or short. Basal innovations extravaginal or intravaginal. Culms erect or geniculately ascending, 40–85 cm long, rooting from lower nodes. Leaf-sheaths smooth. Ligule an eciliate membrane, 4–7 mm long, erose, truncate or obtuse or acute. Leaf-blades flat or involute, 10–25 cm long, 3–6.5 mm wide. Leaf-blade surface smooth or scabrous.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, lanceolate or elliptic, 15–30 cm long. Primary panicle branches 2–11 cm long. Panicle branches smooth or scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 1.5–4.1 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.1–0.3 mm long, 0.1 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.5–4.1 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 1.4–4 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 1.2–3.25 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, truncate or obtuse or acute, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.3–0.8 way up back of lemma, geniculate, 2–4 mm long overall, with twisted column. Palea 0.1–2 mm long, 0.1–0.75 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.55–1.4 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). **Continent.** Temperate Asia, Tropical Asia.

Country /Province /State. **China, Eastern Asia.** Taiwan. **Malesia, Papuasias.** Borneo, Java, Lesser Sunda Is, Sumatra, Sulawesi, Philippines. New Guinea.

Agrostis rosei Scribn. & Merrill. *U.S. Dept. Agric. Bull. Agrost.* 24: 21. (1901).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.N. Rose* 2373, 18 Aug 1897, Mexico: Zacatecas: Sierra Madre mountains, [between Huasemote, Durango, and San Juan Capistrano] (US-301286; IT: NY-327649).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Joseph Nelson Rose (1862–1928) who collected widely in the Americas.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–40 cm long. Ligule an eciliate membrane, 2 mm long. Leaf-blades 5–8 cm long, 2–3 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 10–15 cm long, 6–12 cm wide. Primary panicle branches spreading, whorled at lower nodes, 5–6 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, flexuous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–2.2 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate or ovate, 2–2.2 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate or ovate, 2–2.2 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.5 mm long, hyaline, without keel. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 1.5 mm long overall, with twisted column. Palea 1.3 mm long, 0.75 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.8–1 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Northeast Mexico.

Durango, Zacatecas.

Agrostis rossiae Vasey. *Contrib. U. S. Nat. Herb.* 3: 76. (1892).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *E.A. Ross s.n.*, Jul 1890, USA: Wyoming (US-556216).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (658).

Derivation (Clifford & Bostock 2007): in honor of Edith A. Ross (fl. 1885–95) United States amateur botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 9–15 cm long. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths loose. Ligule an eciliate membrane, 1–2 mm long, erose. Leaf-blades flat or conduplicate, 1–2.5 cm long, 1–2 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 5–6 cm long, with spikelets clustered towards branch tips. Primary panicle branches ascending, whorled at most nodes. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 2–2.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–2.5 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex dentate, 4 -fid, truncate, muticous. Palea 0.6 mm long, 0.4–0.5 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.4–0.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA. Wyoming.

Agrostis rupestris All. *Fl. Pedem.* 2: 237. (1785).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Italy. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Italy: Coll?.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. rupes*, rock; *-estre*, place of growth; Growing amongst rocks.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 10–20 cm long, 2(–3) -noded. Culm-internodes smooth. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 1.5–2 mm long, lacerate, acute. Leaf-blades filiform, convolute, 1.5–5 cm long, 1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 3–5 cm long, 1–3 cm wide. Primary panicle branches ascending, 3–5 -nate, whorled at most nodes. Panicle axis smooth. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, clavate, 1.5–3.5 mm long, 0.75–1 length of fertile spikelet.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2–3.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–3.5 mm long, 1.1–1.6 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.8–2.2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 5 mm long overall, with twisted column. Palea 0.2 mm long, 0.1 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1–1.3 mm long. Caryopsis with adherent pericarp, 1.5 mm long. Hilum linear.

$2n = 14$ (2 refs TROPICOS).

Distribution (TDWG). Continent. Europe, Africa.

Region. Middle Europe, Southwestern Europe, Southeastern Europe, Eastern Europe.

Country /Province /State. : Austria, Czechoslovakia, Germany, Switzerland. : Corsica, France, Spain. : Albania, Bulgaria, Italy, Romania, Yugoslavia. Northwest European Russia, Ukraine. **Northern Africa.** Morocco.

Agrostis salaziensis C. Cordem. ex J. Cordem. *Fl. Ile Peunion* 124 (1895).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Reunion. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Reunion: Salazes.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Salazes, Le Reunion, Mascarenes.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 40–60 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 2 mm long. Leaf-blades 10–20 cm long, 2–8 mm wide. Leaf-blade surface scabrous, rough abaxially. Leaf-blade margins scabrous. Leaf-blade apex attenuate, hardened.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 7–15 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 4–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 4–5 mm long, 0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 4–5 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -

veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 2.5 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma surface pilose, hairy below. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 3–3.5 mm long overall, with twisted column. Palea ovate, 0.3 mm long, 0.15 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Caryopsis with adherent pericarp, 1.7 mm long. Embryo 0.2–0.25 length of caryopsis.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Reunion.

Agrostis salsa Korsh. *Acta Hort. Petrop.* 40: 135 (1928).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Urals, Khalilovo: *Litvinov 2690* (LE holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. saline*. Growing in salty soils.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect or geniculately ascending, 20–70 cm long. Culm-internodes smooth. Ligule an eciliate membrane, 2.5–4.5 mm long. Leaf-blades filiform, involute, 0.5–2 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 4–8 cm long, 0.5–1 cm wide. Primary panicle branches appressed, 3–5 -nate. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.5–2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2 mm long, 1.3–1.6 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.2–1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex truncate, mucous. Palea 0.7 mm long, 0.5 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Europe, Temperate Asia.

Region. Eastern Europe.

Country /Province /State. Central European Russia, East European Russia, South European Russia. Siberia. West Siberia.

Agrostis sandwicensis Hillebr. *Fl. Haw. Isl.* 515. (1888).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, W.D.Clayton & N.Snow, Key to Pacific Grasses (2010).

TYPE from Hawaii. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Hawaii, Maui & Oahu: Coll?.

Illustrations (Books): W.L.Wagner et al., *Manual of the Flowering Plants of Hawai'i*, Vol. 2 (1990) (1493, Pl. 218).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From the Sandwich, now Hawaiian Islands.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 30–50 cm long. Culm-internodes antrorsely scabrous. Leaf-sheaths antrorsely scabrous. Ligule an eciliate membrane, 3 mm long, acute. Leaf-blades involute, 1–2 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 5–10 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3–4 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex acuminate. Upper glume lanceolate, 3–4 mm long, 1.5–2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume surface scabrous. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 4 -fid, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 0.5–4 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Pacific.

Country /Province /State. North-central Pacific. Hawaii.

Agrostis scabra Willd. *Sp. Pl.* 1: 370. (1797).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983), T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: North America: Coll?.

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (121), T. Cope & A. Gray, *Grasses of the British Isles* (92), T.Koyama, *Grasses of Japan and its neighbouring regions* (1987) (195, Fig. 68), K.F.Best, et al, *Prairie Grasses* (1971) (51), M.E.Barkworth et al, *Flora of North America north of Mexico Vol 24 Poaceae*, part 1 (2007) (648), F.W.Gould, *The Grasses of Texas* (1975) (142, Fig. 70).

Derivation (Clifford & Bostock 2007): L. rough or gritty to the touch. Plants with rough leaf-blades, spikelets or stems.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–60 cm long. Ligule an eciliate membrane, 1.5–4 mm long. Leaf-blades 0.5–3 mm wide.

Inflorescence. Inflorescence a panicle, deciduous as a whole. Panicle open, ovate, effuse, 7–30 cm long, with spikelets clustered towards branch tips. Primary panicle branches spreading, rebranched above middle, 5–15 cm long. Panicle branches capillary, flexuous, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.2–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2.2–3 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute or acuminate. Upper glume lanceolate, 2.2–3 mm long, 1.3–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma oblong, 0.9–1.2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex muticous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.6 mm long. Caryopsis with adherent pericarp.

$2n = 42$ (1 ref TROPICOS).

Florets. Fertile lemma elliptic, 2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface glabrous. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, curved, 4 mm long overall. Palea absent or minute.

Flower and Fruit. Lodicules 2, 0.7 mm long, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. **Western South America.** Colombia.

Agrostis schaffneri Fourn. *Mexic. Pl.* 2: 94. 1886.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mexico, Tacubaya: Schaffner 308 (P syn) ; Mexico, Valle de Mexico: Schaffner 86 (LE syn).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Wilhelm Darmstadt Schaffner (-1802) who collected in Mexico.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, culms solitary or caespitose. Culms erect, 60–80 cm long. Culm-internodes smooth. Leaves cauline. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 3–5 mm long. Leaf-blades 12–18 cm long, 2–4 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle open, oblong, 15–30 cm long. Primary panicle branches ascending or spreading, whorled at most nodes, 6–12 cm long. Panicle axis scabrous. Panicle branches stiff, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.5–3 mm long, 1.6–2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, truncate, muticous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Central Mexico, Northeast Mexico, Southwest Mexico.

Distrito Federal, Mexico State, Morelos, Puebla, Tlaxcala. Queretaro. Michoacan, Oaxaca. Chiapas.

Agrostis schlechteri Rendle. *Journ. Bot.* 380. (1899).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from South Africa. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: South Africa: *Schlechter 10274* .

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Friedrich Richard Rudolf Schlechter (1872–1925) German-born botanist and traveller.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms 3–65 cm long. Ligule an eciliate membrane. Leaf-blades 1–10 cm long, 2–2.5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 1–15 cm long. Primary panicle branches ascending. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3–3.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 3–3.5 mm long,

1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 2–2.5 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface pilose. Lemma apex dentate, 4 -fid, truncate, awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 4 mm long overall, with twisted column. Palea 0.66 length of lemma, hyaline, 2 -veined. Rhachilla extension 1.5–2.5 mm long, 0.5–0.75 length of fertile floret, pilose.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Western Cape.

Agrostis schleicheri Jord. & Verlot. *F. Schultz, Arch. Fl. Fr. et Allem.* 339, 347 (1855).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from France. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: France, Jura, Reculet: *Verlot*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Johann Christoph Schleicher (1768–1834) Swiss botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 10–30 cm long. Culm-internodes smooth. Ligule an eciliate membrane, 2–4 mm long, acute. Leaf-blades filiform, 5–10 cm long, 0.5–1.5 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear or lanceolate, 1–6 cm long. Primary panicle branches appressed. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.3 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3–5 mm long, 1.3–1.5 length of upper glume, membranous, pallid, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–4 mm long, 1 length of adjacent fertile lemma, membranous, pallid, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 2–4 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.05 way up back of lemma, geniculate, 5 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.5–2 mm long. Caryopsis with adherent pericarp. Hilum linear.

$2n = 42$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Europe.

Region. Middle Europe, Southwestern Europe, Southeastern Europe.

Country /Province /State. : Austria, Germany, Switzerland. : France, Spain. : Italy.

Agrostis schmidii (Hook.f.) Bor. *Grasses Burma, Ceyl., Ind. & Pakist.* 389 (1960).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. **Basionym or Replaced Name:** *Calamagrostis schmidii* Hook. f., *Fl. Brit. Ind.* 7: 264 (1896). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Ootacamund: Schmid (K holotype).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Ludwig Bernhard Ehregott Schmid (1788–1859) German-born Indian missionary and plant collector.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Rhizomes short. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Culms geniculately ascending, 20–25 cm long. Ligule an eciliate membrane. Leaf-blade base with a false petiole, petiole 0.3–0.5 cm long. Leaf-blades 5–7.5 cm long, 2–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 3–4 cm long. Primary panicle branches 1–2 -nate. Panicle branches capillary, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3–3.5 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 3–3.5 mm long, 1.5–1.7 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface pilose. Lemma apex dentate, 4 -fid, with outer lobes longer, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 3–5 mm long overall, with a straight or slightly twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.
Tamilnadu.

Agrostis schneideri Pilger. *Fedde, Repert.* 17: 130 (1921).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Lichiang: Schneider 2326 (K iso).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Camillo Karl Schneider (1876–1951) German botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations intravaginal. Culms erect or geniculately ascending, 25–30 cm long, 1–2 -noded. Leaf-sheaths smooth. Ligule an eciliate membrane, 2–4 mm long. Leaf-blades flat or involute, 5–8 cm long, 1 mm wide. Leaf-blade surface scaberulous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle open, linear or lanceolate, 5–9 cm long. Primary panicle branches ascending, 2–3 -nate, 1–3 cm long. Panicle axis smooth or scaberulous. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–2.1 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2–2.1 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–2.1 mm long, 1.5–2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1–1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex dentate, 2 -fid, muticous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central. Sichuan.

Agrostis sclerophylla C. E. Hubbard. *Kew Bull.* 1936, 310 (1936).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Ethiopia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: : Based on *Sporobolus alpicola* .

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (48, Fig. 22).

Derivation (Clifford & Bostock 2007): Gk. *skleros*, hard; *phyllon*, leaf. Leaf-blades indurate or coriaceous.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, cushion forming. Culms erect, 2–6 cm long. Ligule an eciliate membrane. Leaf-blades aciculate, involute, 0.5–2 cm long, 0.5–1 mm wide, stiff.

Inflorescence. Inflorescence a panicle, comprising 5–12 fertile spikelets. Panicle open, ovate, 1 cm long, bearing few spikelets. Panicle branches stiff. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume ovate, 2.5–3 mm long, 0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.2–2.7 mm long, 1.1–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.5–2.25 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, muticous or mucronate. Principal lemma awn dorsal, arising 0.5 way up back of lemma. Palea 0.75 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa, East Tropical Africa. Ethiopia (inc. Eritrea). Kenya.

Agrostis serranoi R. Phil. *Anal. Univ. Chil.* 94: 12. (1896).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Chile. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Chile, Rio Palena: Philippi 178 (SGO holo, BAA, W).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (121).

Derivation (Clifford & Bostock 2007): in honor of A. Serrano (prior to 1886) who collected in South America.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Basal innovations extravaginal. Culms erect, 20–60 cm long, 2 -noded. Lateral branches lacking. Leaf-sheaths smooth. Ligule an eciliate membrane, 2.5–5 mm long, scaberulous on abaxial surface, erose. Leaf-blades 3–8 cm long, 2–3 mm wide. Leaf-blade surface smooth or scabrous, rough on both sides. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Peduncle smooth. Panicle open, lanceolate, 8–20 cm long, 2–8 cm wide, with spikelets clustered towards branch tips. Primary panicle branches appressed or ascending, 2–

3-nate, whorled at most nodes, rebranched at middle. Panicle branches flexuous, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 5–15 mm long, smooth or scaberulous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.3–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, hairy in 2 tufts. Floret callus hairs 0.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 2.3–3 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 1-veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.3–3 mm long, membranous, purple, 1-keeled, 1-veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.7–2 mm long, hyaline, without keel, 5-veined, more than 3-veined. Lemma surface scaberulous. Lemma apex muticous or awned, 1-awned. Principal lemma awn dorsal, arising 0.75 way up back of lemma, straight, 1–2 mm long overall. Palea 0.5–0.7 mm long, hyaline.

Flower and Fruit. Lodicules 2, 0.5–0.6 mm long, membranous. Anthers 3, 0.4–0.5 mm long. Caryopsis with adherent pericarp, sulcate on hilar side, 1–1.2 mm long. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Chile Central, Chile South.

Chubut, Neuquén, Río Negro, Santa Cruz. Chiloe, Aisen, Magellanes. Valparaiso, La Araucania. Los Lagos, Aisen, Magellanes.

Agrostis shandongensis F.Z. Li. *Bull. Bot. Res. North-East. Forest. Inst.*, 11(2): 27 (1991).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Shandong, Kunyushan: Zhang 88232.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Shandong Province, China.

Classification. Subfamily Pooideae. Tribe: Poeae.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China North-Central. Shandong.

Agrostis sichotensis N.S. Probatova. *Bot. Zhurn.*, 69(2) : 252 (1984).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online.

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Ternej, Abrek: Schauljskaja (VLA holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Sichte-Alinji Mountains, Siberia.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 45–50 cm long, 1.5–2 mm diam. Culm-internodes smooth. Leaf-sheaths antrorsely scabrous. Ligule an eciliate membrane, (2.5–)3.5–4.5 mm long. Leaf-blades 2–3.5 mm wide, grey-green. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle, comprising 90–150 fertile spikelets. Panicle contracted, lanceolate or oblong, 15 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, (2.7–)3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1-veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate,

(2.7–)3–3.5 mm long, 1.5–1.6 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 4.2 mm long overall, with twisted column.

Flower and Fruit. Anthers 3, 1.6–1.8 mm long.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Russian Far East. Primorye.

Agrostis sinkiangensis Y.C. Yang. *Bull. Bot. Res. North-East. Forest. Inst.* 4(4): 98 (1984).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Nilka Xian: Guan 3968.

Illustrations: None found.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms 20–50 cm long, 2–4 -noded. Leaves cauline. Leaf-sheaths mostly shorter than adjacent culm internode, smooth. Ligule an eciliate membrane, 2 mm long. Leaf-blades 4–10 cm long, 2–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 7–10 cm long, 0.3–1 cm wide. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.5–4.2 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate or oblong, 3.5–4.2 mm long, 1.1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate or oblong, 3.5–4.2 mm long, membranous, purple, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2–3.2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface pilose, hairy below. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33 way up back of lemma, geniculate, 3 mm long overall, with twisted column. Palea 1.4–1.6 mm long, 0.66 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. Xinjiang.

Agrostis sinocontracta S.M.Phillips & S.L.Lu. *Fl. China* 22: 347 (2006).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: : Based on *A. contracta* Yang ; China, Yunnan, Bijiang Xian: Coll. 58618.

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 470).

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms 30–50 cm long, 1–1.5 mm diam., 3–4 -noded. Culm-internodes scaberulous. Leaves cauline. Ligule an eciliate membrane, 1–2 mm long, truncate. Leaf-blades 10–13 cm long, 3–5 mm wide. Leaf-blade surface scabrous. Leaf-blade margins scabrous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 10–15 cm long, 3 cm wide. Primary panicle branches 5–10 -nate, whorled at most nodes. Panicle branches smooth, glabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, smooth, glabrous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2.5–3 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.5–3 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5–1.7 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.66–0.75 way up back of lemma, geniculate, 3 mm long overall, with twisted column. Palea 0.3 mm long, 0.2 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, oblong, 0.6 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central. Yunnan.

Agrostis sinorupestris L.Liu ex S.M.Phillips & S.L.Lu. *Fl. China* 22: 346 (2006).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Yunnan, Lijiang Snow Range: Rock 10774 (US holo).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 469).

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, slender, 12–20(–30) cm long, 0.5 mm diam., 2–3 -noded. Leaf-sheaths mostly shorter than adjacent culm internode. Ligule an eciliate membrane, 0.5 mm long, truncate or obtuse. Leaf-blades flat or involute, 3–15 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 3–8 cm long. Primary panicle branches 2–6 -nate, whorled at most nodes, 2–4 cm long. Panicle branches smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2.8–3.5 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.5–3.2 mm long, 1.2–1.5 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 3.5–5 mm long overall, with a straight or slightly twisted column. Palea 0.4–0.6 mm long, 0.2–0.5 length of lemma, hyaline.

Flower and Fruit. Anthers 3, 0.6–0.8 mm long.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, Tibet. Sichuan, Yunnan.

Agrostis sodiroana Hack. *Oesterr. Bot. Zeitschr* 52(2) :61 (1902).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ecuador, Pichincha: Sodiro 23/3 (W holo, QPLS, S).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. in honor of Luigi Sodiro (1836–1909) Italian-born Ecuadorian cleric and amateur botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–60 cm long. Culm-internodes distally glabrous. Ligule an eciliate membrane, 4–5 mm long. Leaf-blades 10–20 cm long, 2–5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 10–20 cm long, with spikelets clustered towards branch tips. Primary panicle branches drooping. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 3 mm long, 1.5–1.7 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, 1.8–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 2 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.75 way up back of lemma, straight, 2 mm long overall. Palea 1 mm long, 0.5 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Ecuador, Peru.

Agrostis sozanensis Hayata. *Ic. Pl. Formos. 7: 85 (1918).*

Accepted by: W.D.Clayton & K.Harman, *GrassBase (2008)* and online, S-L Chen et al, *Flora of China 22 (Poaceae) (2006)*, T.Koyama, *Grasses of Japan and its neighboring regions (1987)*.

TYPE from Taiwan. T:<Type of Basionym>: *fide TROPICOS and Kew Synonymy Database: Taiwan, Sozan: Coll?.*

Illustrations (Books): C-C Hsu, *Flora of Taiwan, Vol 5 (1978) (248)*, C-C Hsu, *Taiwan Grasses (1975)*, S-L Chen et al, *Flora of China, Illustrations, Poaceae (2007) (Fig. 468)*.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Sozan, Taihoku, Taiwan.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms erect or geniculately ascending, 45–90 cm long, 1–1.2(–2.5) mm diam., 3–5 -noded. Leaf-sheaths smooth. Ligule an eciliate membrane, 2–6 mm long, truncate or obtuse. Leaf-blades 7–20 cm long, 2–5 mm wide. Leaf-blade surface scaberulous, rough on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic or ovate, 15–30 cm long. Primary panicle branches ascending, 2–4(–10) -nate, 5–10 cm long. Panicle branches capillary, flexuous, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 1.8–2.7(–3) mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.1–0.2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute or acuminate. Upper glume lanceolate, 1.8–3 mm long, 1.3–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma oblong or ovate, 1.3–2 mm long, hyaline, without keel, 4–5 -veined, more than 3-veined. Lemma apex truncate or obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5–0.66

way up back of lemma, straight or curved, 1–2(–3) mm long overall. Palea 0.25–0.5 mm long, 0.25–0.33 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Anthers 3, 0.7–1.2 mm long.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China, Eastern Asia. China South Central, China Southeast. Taiwan.

Anhui, Fujian, Guangdong, Henan, Hunan, Jiangsu, Jiangxi, Zhejiang. Guizhou, Hubei, Sichuan, Yunnan.

Agrostis stolonifera Leers, non L.(1753). *Fl. Herborn* :20 (1775).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000) (& as *A. maritima*), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*), N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983), T.Koyama, *Grasses of Japan and its neighboring regions* (1987), W.D.Clayton & N.Snow, Key to Pacific Grasses (2010).

TYPE from Europe. **Basionym or Replaced Name:** *Agrostis transcaspica* Litw. *Sched. Herb. Fl. Ross.* 8: 146 (1922), *A. palustris* Huds., *Fl. Angl.* 27 (1762). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Herb. A. van Royen*, Europe (L-912.356–55). LT designated by Widin, *Fl. Fenn.* 5: ? (1971).

Derivation (Clifford & Bostock 2007): *L. stolo*, shoot; *fero*, bear. Plant with well developed underground stems.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Stolons present. Culms geniculately ascending or decumbent, 8–40 cm long, 2–5 -noded, rooting from lower nodes. Culm-internodes smooth. Leaf-sheaths without keel, smooth. Ligule an eciliate membrane, 1–6 mm long, obtuse. Leaf-blades 1–10 cm long, 0.5–5 mm wide. Leaf-blade surface ribbed, scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, linear or lanceolate or oblong, continuous or interrupted, dense or loose, 1–13 cm long, 0.4–2.5 cm wide. Primary panicle branches whorled at most nodes. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 0.5–2 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 2–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1–1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume

lanceolate, 1.3–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic to oblong, 1.5–2.3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex obtuse. Palea oblong, 0.6–0.8 length of lemma, hyaline, 2 -veined. Palea apex obtuse.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 1–1.5 mm long. Stigmas 2, laterally exerted. Caryopsis with adherent pericarp, ellipsoid, isodiametric, biconvex, estipitate, without sulcus, smooth, apex unappendaged. Embryo 0.2 length of caryopsis. Hilum linear, 0.9 length of caryopsis. Endosperm farinose.

Agrostis striata Colenso. *Trans. N. Z. Inst.* 21: 107. (1889).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from New Zealand. **Basionym or Replaced Name:** *Lachnagrostis striata* (Colenso) Zotov, *Rec. Domin. Mus., N. Zeal.* 5: 142 (1965). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New Zealand, Lake Waikaremoana: *Hill* (AK holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. stria*, furrow; *-ata*, possessing. Glumes and lemmas streaked.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Basal innovations extravaginal. Culms erect or geniculately ascending, 5–15 cm long. Culm-internodes retrorsely scabrous. Leaf-sheaths smooth or scaberulous. Ligule an eciliate membrane, 1–3 mm long, scaberulous on abaxial surface, erose, obtuse. Leaf-blades conduplicate, 2–10 cm long, 0.8–2 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade margins scabrous. Leaf-blade apex obtuse.

Inflorescence. Inflorescence a panicle, deciduous as a whole. Panicle open, elliptic, 2–10 cm long, 1.5–7 cm wide. Panicle branches capillary, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2.2–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.3 mm long, 0.25 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume linear or lanceolate, 1.05 length of upper glume, membranous, much thinner on margins, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate or elliptic, 2.2–3.5 mm long, 1.3–1.5 length of adjacent fertile lemma, membranous, with hyaline margins, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong or ovate, 1.2–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex truncate, awned. Principal lemma awn dorsal, arising 0.66–0.75 way up back of lemma, straight, 0.2–2 mm long overall. Palea 0.66–1 length of lemma, hyaline, 2 -veined. Palea apex with excurrent keel veins. Rhachilla extension 0.5 mm long, pubescent, with 0.5 mm long hairs.

Flower and Fruit. Lodicules 2, linear, membranous, acute. Anthers 3, 0.2–0.5 mm long. Caryopsis with adherent pericarp, 0.8–1.4 mm long.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand North I, New Zealand South I.

Agrostis subpatens Hitchcock. *N. Am. Fl.* 17: 527 (1937).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Costa Rica. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Costa Rica, Cerro de la Muerte: Pittier 10470 (US holo).

Illustrations (Books): W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (37, Fig. 37).

Derivation (Clifford & Bostock 2007): *L. sub*, approaching.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 20–50 cm long, 0.5–1 mm diam., 2 -noded. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 3–5 mm long. Leaf-blades erect, filiform, conduplicate, 5–15 cm long, 0.6 mm wide. Leaf-blade surface ribbed, scaberulous, rough abaxially.

Inflorescence. Inflorescence a panicle. Peduncle 3–5 cm long. Panicle open, ovate, 8–9 cm long. Primary panicle branches spreading, 2–8 -nate, whorled at most nodes. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–2 length of fertile spikelet, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.9–3.7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume oblong, 2.9–3.7 mm long, 1.1–1.2 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper

glume oblong, 2.5–3.5 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.7–2.2 mm long, hyaline, without keel. Lemma lateral veins extending close to apex. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 3 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1–1.5 mm long, purple. Caryopsis with adherent pericarp, ovoid, 1.3–1.4 mm long. Hilum linear.

$2n = 28$ (1 ref TROPICOS).

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Central Mexico, Northeast Mexico, Gulf (Mexico), Southwest Mexico, Southeast Mexico. **Mesoamerica.** Costa Rica, Guatemala.

Distrito Federal, Mexico State, Puebla, Tlaxcala. Hidalgo. Veracruz. Jalisco. Chiapas.

Agrostis subrepens (Hitchcock) Hitchcock. *N. Am. Fl.* 17: 525 (1937).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Mexico. **Basionym or Replaced Name:** *Agrostis hyemalis* var. *subrepens* Hitchc., *Bull. US Dept. Agric. Bur. Pl. Ind.* 68:44 (1905). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mexico, Sierra Madre: Pringle 1420 (K iso, NY).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. sub*, approaching. *L. repo*, crawl. Rhizome well developed.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, 60–100 cm long, 3–4 -noded, with 0.5 of their length below uppermost node. Culm-internodes smooth. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 3–5 mm long. Leaf-blades involute, 1–1.3 mm wide. Leaf-blade surface scaberulous. Leaf-blade apex hardened.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 12–18 cm long, 10–15 cm wide. Primary panicle branches spreading, whorled at most nodes, 6–8 cm long. Panicle axis smooth. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 2.5 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, 2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, truncate, muticous. Palea 0.3 mm long, 0.1 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Northeast Mexico. **Northern South America, Western South America.** Bolivia, Colombia, Ecuador.

Chihuahua.

Agrostis subulata Hook. f. *Fl. Antarct.* 95. (1845).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from New Zealand. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New Zealand, Campbell's Is.: *Hooker 1627* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. subulus*, a fine point; -ata, possessing. Glumes, lemmas or calluses sharply tapered.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations intravaginal. Culms 3–9 cm long. Leaf-sheaths scaberulous. Ligule an eciliate membrane, 0.8–1 mm long, scaberulous on abaxial surface, erose. Leaf-blades involute, 1.5–4 cm long, 0.3–0.6 mm wide. Leaf-blade surface scaberulous, rough on both sides. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence a panicle, aerial or shorter than basal leaves. Peduncle antrorsely scabrous above. Panicle spiciform, oblong, 1–2 cm long. Primary panicle branches appressed. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2–3.3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 2–3.3 mm long, 1 length of upper glume, membranous, light green, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex acute. Upper glume lanceolate, 2–3.3 mm long, membranous, light green, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface scabrous. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.3–1.6 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma margins scabrous. Lemma apex erose, truncate, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.66 way up back of lemma, straight, 1–2 mm long overall. Palea 0.3–0.4 mm long, 0.25 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.4 mm long, membranous. Anthers 3, 0.5–0.7 mm long. Caryopsis with adherent pericarp. Hilum linear.

n = 21 (1 ref TROPICOS).

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. Campbell Is, Auckland Is.

Agrostis subulifolia Stapf. *Kew Bull.* 1910, 130. (1910).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: South Africa, Doodmans Krans Mt.: *Galpin 6910* ; South Africa, Wittebergen: *Galpin 6911* .

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. subulus*, fine sharp point; folium, a leaf. Leaf-blades narrow, tapering.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms weak, 5–30 cm long. Ligule an eciliate membrane. Leaf-blades filiform, conduplicate, 1–7 cm long, 0.5–1 mm wide, stiff.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, linear or lanceolate, 1.5–8 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2–3 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–3 mm long, 1.1–1.2 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.7–2.7 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma surface glabrous. Lemma apex dentate, 4 -fid, truncate, muticous or awned. Principal

lemma awn dorsal, arising 0.33 way up back of lemma, straight, 0–1.5 mm long overall, without a column. Palea 0.66 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Kwazulu-Natal, Lesotho, Eastern Cape.

Agrostis tandilensis (Kuntze) L. Parodi. *Darwiniana*, 6:158 (1943).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online (as *Bromidium*), W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. **Basionym or Replaced Name:** *Bromidium hygrometricum* var. *tandilense* Kuntze, *Rev. Gen. Pl.* 3:343 (1898). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Argentina, Sierra Tandil: Kuntze (LP lecto).

Recent Synonyms: *Bromidium tandilense* (Kuntze) Rugolo, *Darwiniana*, 24: 202 (1982). *Agrostis kennedyana* A. A. Beetle, *Bull. Torr. Bot. Cl.* 72: 547 (1945).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (160, as *Bromidium*), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (697 as *Bromidium tandilense*), E.G.Nicora, *Los Generos de Gramineas de America Austral* (1987) (176, Fig. 46 as *Bromidium*), A.Burkat, *Flora Ilustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (127, Fig. 41), A.L.Cabrera, *Flora de la Provincia de Buenos Aires, IV Pt 2 Gramineas* (1970) (228, Fig. 60), B.Rosengurt, *Gramineas Uruguayas I* (1970) (22, Fig. 3).

Illustrations (Journals): *Darwiniana* (24: 198, Fig.3 (1982) as *Bromidium hygrometricum*).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Sierra de Tandil, Argentina.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect, 5–40 cm long. Ligule an eciliate membrane, 2 mm long. Leaf-blades 2–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 4–7 cm long, 0.5–0.9 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3–3.5 mm long, 1 length of upper glume, membranous, much thinner on margins, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3–3.5 mm long, 2 length of adjacent fertile lemma, membranous, with hyaline margins, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex dentate, 4 -fid, truncate, awned, 3 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 5–5.5 mm long overall, with twisted column. Lateral lemma awns present, arising on apex of lobes (outer lobes), 1–1.5 mm long. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 1 (plus 2 rudiments), 0.3–0.4 mm long. Caryopsis with adherent pericarp, 1.3 mm long, dark brown. Hilum linear.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Northwest Mexico. **Brazil, Southern South America.** Brazil South. Argentina Northeast.

Rio Grande do Sul, Santa Catarina. Buenos Aires, Cordoba, Corrientes, Entre Rios, Misiones. Baja California.

Agrostis tateyamensis Tateoka. *Bot. Mag. Tokyo*, 88 (1010): 84 (1975).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Japan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Japan, Mt. Tateyama: Tateoka 7397 (TNS holo, KYO, TI).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Tateyama (Mt. Tate), a mountain in Toyama Prefecture, Japan.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending, 15–30 cm long. Ligule an eciliate membrane, 0.5–2 mm long, obtuse. Leaf-blades flat or involute, 3–10 cm long, 0.5–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 5–12 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 1.9–2.8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.9–2.8 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 1.9–2.8 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume apex acuminate.

Florets. Fertile lemma ovate, 1.8–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure, extending close to apex. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 1.4–3.2 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.5–0.8 mm long. Caryopsis with adherent pericarp. Hilum linear.

$2n = 42$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Japan.

Agrostis taylori C. E. Hubbard. *Kew Bull.* 1937, 63 (1937).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Uganda. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Uganda, Mt. Muhavura: Taylor 2133 (BM holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of William Ernest Taylor (1856–1927) English cleric who collected in tropical East Africa.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending or decumbent, 15–30 cm long. Ligule an eciliate membrane, 2–4 mm long. Leaf-blades flat, 5–12 cm long, 1–2 mm wide. Leaf-blade surface glabrous. Leaf-blade apex obtuse.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 8–14 cm long, 1.5–5 cm wide. Primary panicle branches spreading, 2 -nate, 2–5 cm long. Panicle branches stiff, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 3–10 mm long, smooth.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension or with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 2.5–3 mm long, 1.1 length of upper glume, membranous, glandular (on veins), 1-keeled, 3 -veined. Lower glume apex obtuse or acute. Upper glume lanceolate, 2.2–2.8 mm long, 1–1.2 length of adjacent fertile lemma, membranous, glandular (on veins), 1-keeled, 3 -veined. Upper glume apex obtuse or acute.

Florets. Fertile lemma elliptic, 2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface asperulous, rough above. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.3–0.4 way up back of lemma, geniculate, 2.5–4.5 mm long overall, with a straight or slightly twisted column. Palea 0.4 length of lemma, hyaline, 0–2 -veined, without keels or 2-keeled. Rhachilla extension 0.1 length of fertile floret, pubescent.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.6–1 mm long. Caryopsis with adherent pericarp, 1.5 mm long. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, East Tropical Africa. Rwanda, DRC. Uganda.

***Agrostis tenerrima* Trin. *Gram. Unifl.* 205 (1824).**

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Spain. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Spain: Coll?.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. very thin. Culms or inflorescence branches thin.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, 20–40 cm long, 4–5 -noded. Culm-internodes retrorsely scabrous. Leaf-sheaths smooth or papillose, glabrous on surface. Ligule an eciliate membrane, 1–3 mm long, lacerate, obtuse. Leaf-blades conduplicate, 1–5 cm long, 0.2–2 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 4.5–14 cm long, 2.5–8 cm wide. Primary panicle branches spreading, 4–6 -nate, whorled at most nodes. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, clavate, 1.5–5 mm long, 2.5–7 length of fertile spikelet.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 0.6–0.7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2.7–5.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume lanceolate, 0.6–0.7 mm long, 1.4–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex obtuse.

Florets. Fertile lemma elliptic, 0.4–0.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure, extending close to apex. Lemma apex erose, truncate, muticous. Palea 0.1 mm long, 0.2 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.3–0.4 mm long. Caryopsis with adherent pericarp, 0.5–0.6 mm long. Hilum linear.

Derivation (Clifford & Bostock 2007): in honor of Joy Thompson, a botanist from the National Herbarium, Sydney.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Culms erect or geniculately ascending, slender, 20–40 cm long, 2 -noded. Culm-internodes striate. Leaves mostly basal. Leaf-sheaths loose. Ligule an eciliate membrane, 3–5 mm long, obtuse. Leaf-blades 2.5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or ovate, 6–12 cm long, bearing few spikelets. Panicle branches straight. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, straight, 1–2 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.5–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 1.5–2.5 mm long, 1 length of upper glume, membranous, light green or purple, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.5–2.5 mm long, 1.1–1.4 length of adjacent fertile lemma, membranous, light green or purple, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma oblong, 1.3–1.8 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, mucicous. Palea absent or minute.

Flower and Fruit. Anthers 3, 0.4–0.5 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Victoria, Tasmania. Tablelands.

Agrostis tibetica DeMire & Quezel. *Bull. Soc. Bot. France* 106: 137, f. 1,2.. 1958.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Chad. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Chad, Tibesti, Emi Koussi: Mire.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Tibesti Mountains, on border of Chad and Libya.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Culms 30–60 cm long, 3–5 -noded. Leaf-sheaths 3–12 cm long. Ligule an eciliate membrane, 5–6 mm long. Leaf-blades flat, 5–7.5 cm long, 2.5–3 mm wide. Leaf-blade surface scaberulous, glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear. Panicle axis pubescent. Panicle branches pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 0.6–0.8 mm long, pubescent, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 2.4–2.6 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume margins ciliolate. Lower glume apex acute. Upper glume lanceolate, 2.4–2.6 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume margins ciliolate. Upper glume apex acute.

Florets. Fertile lemma oblong, 2.5 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure, excurrent. Lemma surface scaberulous, rough above, glabrous. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.75 way up back of lemma, geniculate, 1.5 mm long overall, with a straight or slightly twisted column. Palea 0.8–1.1 mm long, 0.5 length of lemma, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, 0.5–0.6 mm long, membranous. Anthers 3, yellow.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Chad.

Agrostis tilenii G. Nieto Feliner & S. Castroviejo. *An. Jard. Bot. Madrid* 40(2): 472 (1984).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Spain. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: : Based on *A. exasperata* Feliner & Castro ; Spain, Mt. Tileni: Feliner 719 (MA holo).

Recent Synonyms: *Agrostis exasperata* G. Nieto Feliner & S. Castroviejo, non Trin.(1845), *An. Jard. Bot. Madrid*, 39(2): 382 (1983).

Illustrations (Books): L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (476, Fig. 102 as *A. exasperata*), M.N.Corrêa, *Flora Patagonica Parte III, Gramineae* (1978) (396, Fig. 265 as *A. exasperata*).

Derivation (Clifford & Bostock 2007): from Serra del Telino, Spain.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Basal innovations intravaginal. Culms erect, 6–17 cm long, 2–3 -noded. Leaf-sheaths antrorsely scabrous. Ligule an eciliate membrane, 3–4 mm long, 2.5–3 mm long on basal shoots, lacerate. Leaf-blades conduplicate, 1.5–12 cm long, 0.4–1.7 mm wide, glaucous. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 1.5–8 cm long, 0.4–1 cm wide. Primary panicle branches appressed, 2–4 -nate. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension or with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 2.2–2.3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.3 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface scabrous, rough above. Lower glume apex acute. Upper glume lanceolate, 2.2–2.3 mm long, 1–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface scabrous, rough above. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.5–2.3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface scabrous, rough below. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33 way up back of lemma, geniculate, 1 mm long overall, with twisted column. Palea oblong, 2 mm long, 0.2 length of lemma, hyaline, 2 -veined. Apical sterile florets 1 in number, barren, lanceolate, 0.5 mm long. Apical sterile lemmas awned, 1 -awned. Apical sterile lemma awns 0.5 mm long.

Flower and Fruit. Lodicules 2, lanceolate, 0.3 mm long, membranous. Anthers 3, 1–1.7 mm long. Stigmas 2, laterally exerted. Caryopsis with adherent pericarp, 1.7 mm long, apex unappendaged. Hilum linear. Endosperm farinose.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Tristan da Cunha. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Tristan da Cunha, Inaccessible Is.: Christopherson 2578 (K holo, O).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *Gk trachys*, rough; *chlaena*, cloak. Glumes scabrid.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Stolons present. Culms decumbent, 20–55 cm long. Culm-internodes terete, smooth, distally glabrous. Lateral branches ample. Leaf-sheaths longer than adjacent culm internode, striately veined, smooth or scaberulous, glabrous on surface. Ligule an eciliate membrane, 1–3 mm long, lacerate. Leaf-blades 2–7 cm long, 0.5–2 mm wide. Leaf-blade surface ribbed, grooved adaxially, scaberulous, rough adaxially. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate or oblong, 1.5–5.5 cm long, 0.6–1.6 cm wide. Primary panicle branches appressed or ascending, 3–5 -nate, 0.3–1.5 cm long. Panicle axis glabrous or hispidulous. Panicle branches stiff, flexuous, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, clavate, terete, 0.3–2 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear or lanceolate, laterally compressed, 3–4 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes deciduous, similar, with lower wider than upper, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 3–4 mm long, 1.3–1.4 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex acute. Upper glume lanceolate, 2–3 mm long, membranous, 1-keeled, 1–3 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent or distinct. Upper glume surface scabrous. Upper glume apex acute.

Florets. Fertile lemma oblong or ovate, dorsally compressed, 1.3–1.8 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent or extending close to apex. Lemma apex erose, obtuse. Palea oblong, 0.6–0.8 mm long, 0.2 length of lemma, hyaline, 2 -veined. Palea surface scaberulous. Palea apex obtuse.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Antarctica.

Country /Province /State. Subantarctic islands. Tristan de Cunha.

Agrostis trachyphylla Pilger. *Notizbl. Bot. Gart. Berlin* 9: 512 (1926).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Kenya. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mt. Kenya: *Fries 1308* (K iso).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *trachys*, rough; phyllon, leaf. Leaf-blades scabrid.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 6–50 cm long. Ligule an eciliate membrane. Leaf-blades filiform, involute, 5–15 cm long, 1 mm wide, stiff. Leaf-blade venation with continuous uniform subepidermal sclerenchyma layer on the underside. Leaf-blade surface scabrous, rough abaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 3–15 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 3–4.5 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scaberulous. Lower glume surface asperulous. Lower glume apex acute. Upper glume lanceolate, 3–4.5 mm long, 1.2–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume surface asperulous. Upper glume apex acute.

Florets. Fertile lemma ovate, 2.5–3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface pubescent. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 3 mm long overall, with twisted column. Palea 1 length of lemma, hyaline, 2 -veined. Rhachilla extension 0.05–0.1 length of fertile floret.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, East Tropical Africa. DRC. Kenya, Tanzania, Uganda.

Recent Synonyms: *Deyeuxa tripilifera* (Hook.f.) Keng, *Sunyatsenia*, 6: 68 (1941).

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (605, Fig. 26).

Derivation (Clifford & Bostock 2007): *L. tres*, three; *arista*, bristle; -ata, possessing. Spikelets with lower glume two-awned and upper glume one-awned.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, slender, 12–60 cm long, 2–3 -noded. Culm-nodes brown. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 3–7 mm long, acute. Leaf-blades 4–16 cm long, 2–5 mm wide. Leaf-blade surface smooth or scaberulous. Leaf-blade margins scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic or pyramidal, 5–16 cm long, 1–8 cm wide. Primary panicle branches spreading. Panicle branches capillary, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 4.5–5.5 mm long, 0.8–1 mm wide, breaking up at maturity, disarticulating below each fertile floret. Floret callus 0.33 mm long, pubescent. Floret callus hairs 1 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 4–5.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 4.2–5 mm long, 1.3–1.7 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma apex dentate, 4 -fid, truncate, awned, 3 -awned. Principal lemma awn dorsal, arising 0.33 way up back of lemma, geniculate, 6–7.5 mm long overall, with twisted column. Lateral lemma awns present. Palea 2.2–2.5 mm long, 0.75 length of lemma, hyaline, 2 -veined. Palea keels scaberulous, adorned above. Rhachilla extension 0.4 mm long, pilose.

Flower and Fruit. Lodicules 2, 0.7 mm long, membranous. Anthers 3, 0.5–0.7 mm long. Caryopsis with adherent pericarp, ellipsoid, 1.3 mm long. Hilum linear.

n = 14 (1 ref TROPICOS).

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent, Indo-China. Eastern Himalaya. Darjeeling, Bhutan, Sikkim. West Bengal.

Agrostis trichoides (HBK) Roem. & Schult. *Syst.* 2: 361 (1817).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Peru. **Basionym or Replaced Name:** *Vilfa trichoides* H. B. & K., *Nov. Gen. et Sp.* 1: 139 (1815). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Peru, Near Monta, Santa Cruz & Guambos: Humboldt & Bonpland (P holo).

Illustrations (Journals): *Ruizia* (13:174, Fig 19d-f (1993)).

Derivation (Clifford & Bostock 2007): Gk. *thrix*, hair; -odes, resembling. Leaf-blades slender.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 10–20 cm long. Leaves mostly basal. Ligule an eciliate membrane, 2–2.5 mm long. Leaf-blades filiform, involute, 1–3 cm long, 1 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 2–5 cm long. Primary panicle branches ascending or spreading. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, reaching apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, mucicous. Palea 0.66 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America. Venezuela. Colombia, Ecuador, Peru.

Agrostis tsaratananensis A. Camus. *Bull. Soc. Bot. France*, 78: 35. (1931).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madagascar, Tsaratanana: *Perrier 16374*.

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (113, Fig. 34).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Mt Tsaratanana, Madagascar.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms geniculately ascending, 45–100 cm long. Ligule an eciliate membrane, 2.5–4.5 mm long. Leaf-blades 15–20 cm long, 3–5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 15–30 cm long, 10–15 cm wide. Primary panicle branches whorled at lower nodes, 5–12 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3.5–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3.5–4.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 3.5–4.5 mm long, 1.4–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 2.5–3 mm long, hyaline, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins excurrent. Lemma surface puberulous. Lemma apex erose, truncate, awned, 1 -awned.

Principal lemma awn dorsal, arising 0.25–0.33 way up back of lemma, straight, 4–5 mm long overall, without a column. Palea 1 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Agrostis tsiafajavonensis A. Camus. *Bull. Soc. Bot. France*. 106: 339 (1960).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Madagascar, Mt. Tsiafajavona: Perrier 13556 ; Madagascar, Mt. Tsiafajavona: Perrier 14715 ; Madagascar, Mt. Tsiafajavona: Perrier 15811.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Mount Tsiafajavona, Madagascar.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending or decumbent, slender, 30–40 cm long. Culm-internodes smooth, distally glabrous. Culm-nodes brown. Leaf-sheaths striately veined. Ligule an eciliate membrane, 3 mm long. Leaf-blades 10–17 cm long, 3–4 mm wide. Leaf-blade surface glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, effuse, 13–16 cm long. Primary panicle branches spreading, 4–5 -nate, whorled at lower nodes, 3–6 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 5–10 mm long, ciliate.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 4–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 4–4.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acuminate. Upper glume lanceolate, 4–4.5 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 2.5–3 mm long, hyaline, without keel. Lemma surface pubescent. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, straight, 5 mm long overall, without a column. Palea hyaline.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Agrostis tsitondroinensis A. Camus. *Not. Syst., Paris*, 15: 136 (1956).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Madagascar, Mt. Tsitondroina: Boileau 4730.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Mt Tsitondroina, Madagascar.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms 2.5 mm diam., 4 -noded. Culm-internodes ridged, smooth, distally glabrous. Leaf-sheaths striately veined, smooth, glabrous on surface. Ligule an eciliate membrane, 3–4 mm long. Leaf-blades 12–16 cm long, 3–4 mm wide. Leaf-blade surface scaberulous, glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 20–25 cm long, 12–13 cm wide. Primary panicle branches spreading, 5–6 -nate, whorled at lower nodes. Panicle axis with lower internodes 5 cm long, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–3 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 4.5–4.7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume lanceolate, 4.5–4.7 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 4.5–4.7 mm long, 1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 2.5–3 mm long, hyaline, without keel. Lemma lateral veins extending close to apex. Lemma surface pilose. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 4–5 mm long overall, with twisted column. Palea hyaline.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Agrostis tungnathii S. Bhattacharya & S.K. Jain. *Bull. Bot. Surv. India*, 25:204 (1985).

Accepted by: U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Uttar Pradesh, Tungnath: Bhattacharya 1524 (CAL holo, BSD).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): from Tungnath, a mountain in Uttar Pradesh, India.

Classification. Subfamily Pooideae. Tribe: Poeae.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.

Uttah Pradesh.

Agrostis turkestanica Drobov. *Fl. Uzbekist.*, ed. Schreder, 1: 202, 537 (1941).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Turkestan region of Kazakhstan.

Classification. Subfamily Pooideae. Tribe: Poeae.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Middle Asia, Western Asia, China. Kazakhstan, Kirgizistan, Tadjhikistan, Uzbekistan. Iran. Xinjiang.

Agrostis turrialbae Mez. *Fedde, Repert.* 18: 4 (1922).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Costa Rica. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Costa Rica, Volcan Turrialba: Pittier 855 (B holo, US).

Illustrations (Books): W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (34, Fig. 6).

Derivation (Clifford & Bostock 2007): from Mt. Turrialba, a volcano in Costa Rica.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending or decumbent, 10–40 cm long, 0.5–1 mm diam., 1–2 -noded, without nodal roots or rooting from lower nodes. Culm-nodes purple. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 1.5–3.5 mm long. Leaf-blades flat, 5–10 cm long, 1–2 mm wide. Leaf-blade surface ribbed, smooth or scaberulous. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Peduncle 5–10 cm long. Panicle open, elliptic or pyramidal, 4–12 cm long, 2–6 cm wide. Primary panicle branches 3–6 -nate, whorled at most nodes. Spikelets ascending, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–2.1 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume oblong, 2–2.1 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume oblong, 1.8–2 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 1.2–1.4 mm long, hyaline, without keel. Lemma lateral veins extending close to apex. Lemma apex erose, obtuse, mucous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.7 mm long, purple. Caryopsis with adherent pericarp, ellipsoid. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica, Northern South America, Western South America. Costa Rica, Guatemala. Venezuela. Colombia.

Agrostis tuvunica G.A. Peshkova. *Fl. Sibir. (Poaceae)*, 2: 111 (2001).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Tuva: Krasnoborov & Chanaminzum 732.

Illustrations: None found.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes short. Culms 15–55 cm long. Ligule an eciliate membrane, 1–2 mm long. Leaf-blades 1–2(–3.5) mm wide, light green. Leaf-blade surface scabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, lanceolate, 5–13 cm long, 1–3 cm wide. Primary panicle branches ascending. Panicle branches smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2–2.5 mm long, 1.1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1.9–2.4 mm long, 1.2 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.7–2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33–0.5 way up back of lemma, geniculate, with twisted column. Palea absent or minute.

Flower and Fruit. Anthers 3, 0.8–1.2 mm long.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Siberia. Tuva.

Agrostis uliginosa Phil. *Anales Univ. Chil.* 27: 323. (1865).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Chile, Mirador: Philippi (SGO holo, B).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (124), M.N.Correa, *Flora Patagonica* Parte III, Gramineae (1978) (372, Fig. 247).

Derivation (Clifford & Bostock 2007): *L. uligo*, wetness of the earth; -osa, abundance. Growing in swampy places.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 60–85 cm long. Culm-nodes brown, glabrous. Leaf-sheaths tight, 7–12 cm long, smooth or scaberulous. Ligule an eciliate membrane, 3–5 mm long, obtuse. Leaf-blades 4–17 cm long, 2–6 mm wide. Leaf-blade surface smooth or scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 11–23 cm long. Primary panicle branches whorled at most nodes. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.1–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose. Floret callus hairs 0.25 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3.1–4.5 mm long, 1.5–2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2–2.2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface scaberulous, rough on veins. Lemma apex awned, 1 -awned. Principal lemma awn dorsal, arising 0.33–0.5 way up back of lemma, straight, 3.5–4 mm long overall. Palea 0.8–1 mm long, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.5–0.8 mm long. Caryopsis with adherent pericarp, 1.5–1.6 mm long. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina South, Chile Central, Chile South.

Chubut, Neuquén, Río Negro, Santa Cruz, Tierra del Fuego. Rest of Chile- Biobio, La Araucania, Maule, O'Higgins, Santado, Valpariso, Chiloe, Aisen, Magellanes. Biobio, La Araucania. Los Lagos, Aisen, Magellanes.

Agrostis umbellata Colla. *Mem. Acc. Torin.* 39: 23. (1836).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. **Basionym or Replaced Name:** *Colpodium pusillum* Nees, *Fl. Afr. Austr.* 149 (1841). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: : Based on *Colpodium pusillum* ; South Africa, Table Mt: Drege (B holo, K).

Recent Synonyms: *Agrostis paradisiaca* Steud., *Syn. Pl. Gram.* 163 (1854).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. umbella*, parasol; -ata, possessing. Inflorescence branches whorled.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual or perennial, short-lived, caespitose. Culms erect, 20–65 cm long, 2–3 -noded. Culm-internodes brown, distally glabrous. Lateral branches lacking. Leaf-sheaths striately veined, glabrous on surface. Ligule an eciliate membrane, 2.5–3 mm long, glabrous on abaxial surface, erose, acute. Leaf-blades 3–8 cm long, 1–2 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 8–13 cm long, 5–10 cm wide. Primary panicle branches whorled at most nodes, branching divaricately. Panicle axis smooth. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 8–22 mm long, scabrous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.7–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus sparsely hairy, hairy on the margins.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acuminate. Upper glume lanceolate, 2.7–4 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, 1.8–2.2 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface scaberulous. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn subapical, straight, 1.4–2.5 mm long overall, clearly exerted from spikelet. Palea 0.2–0.4 mm long, 0.1–0.2 length of lemma, 0 -veined.

Flower and Fruit. Lodicules 2, 0.3 mm long, membranous. Anthers 3, 1–1.4 mm long. Caryopsis with adherent pericarp, 1.6–1.7 mm long. Hilum elliptic. Endosperm farinose.

Distribution (TDWG). **Continent.** South America.

Country /Province /State. **Southern South America.** Chile Central.

Rest of Chile- Biobio, La Auracania, Maule, O'Higgins, Santado, Valpariso. Valparaiso, Santiago, O'Higgins, Maule, Biobio, La Araucania.

Agrostis ushae H.J. Noltie. *Edinburgh J. Bot.*, 56(3): 388 (1999).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Upper Lasha Chhu valley: *EENS 360* (E holo, BSHC).

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (605, Fig. 26).

Derivation (Clifford & Bostock 2007): in honor of Usher Ganguli Lachungpa, of the Forest Department, Sikkim State, India.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Stolons absent. Culms 25–50 cm long. Culm-nodes glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 3.5–4 mm long, acute. Leaf-blades 7–15 cm long, 2.5–3 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted or spiciform, linear, continuous or interrupted, 9–18 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1.5–2.5 mm long, 0.5–0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3–3.5 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 1.5–2 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.3–0.4 way up back of lemma, geniculate, 3.5 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.5–0.75 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). **Continent.** Tropical Asia.

Country /Province /State. **Indian Subcontinent.** Eastern Himalaya. Sikkim.

Agrostis variabilis Rydb. *Mem. N. York Bot. Gard.* 1: 32. (1900).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Canada. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: : Based on *A. varans* Trin. ; Canada: Hooker 217 (LE holo).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (657).

Derivation (Clifford & Bostock 2007): *L. varius*, variable; -abilis, indicating capacity.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 8–15 cm long. Lateral branches lacking. Leaves mostly basal. Ligule an eciliate membrane, 0.5–2.5 mm long, lacerate, truncate. Leaf-blades flat or conduplicate, 1–2 mm wide. Leaf-blade surface smooth or scaberulous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 3–6 cm long, 0.5–1 cm wide. Primary panicle branches appressed, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, reaching apex of florets or exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 2.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface smooth or asperulous. Lower glume apex acute. Upper glume lanceolate, 2.5 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume surface smooth or asperulous. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins extending close to apex. Lemma apex erose, truncate, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.4–0.5 way up back of lemma, straight, 2–2.5 mm long overall. Palea 0.2–0.4 mm long, 0.1–0.2 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, 0.3–0.5 mm long, membranous. Anthers 3, 0.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Western Canada, Northwest USA, Southwestern USA. Alberta. Colorado, Idaho, Oregon, Washington. California, Nevada, Utah.

Agrostis venezuelana Mez. *Fedde, Repert.* 18: 4 (1922).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Venezuela, Pico de Naiguata: Pittier.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating location. From Venezuela.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms 30–40 cm long. Ligule an eciliate membrane, lacerate. Leaf-blades 2–3 mm wide. Leaf-blade surface scaberulous, rough on both sides.

Inflorescence. Inflorescence a panicle. Peduncle scaberulous above. Panicle open, ovate, 8–10 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, smooth, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.3 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 3.3 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3 mm long, 1.7 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.75 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 4 -fid, mucicous. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.75 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Agrostis venusta Trin. *Mem. Acad. Petersb. Ser. 6*, 4(3–4): 340. (1845).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, D.Sharp, D. & B.K.Simon, *AusGrass* (2002), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Australia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Australia, Tasmania: Coll?.

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (185, Fig. 134), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (473, Fig. 92), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (111), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (168, Fig. 25), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): L. beautiful, graceful. Mostly a reference to habit.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect, 15–40 cm long, 2 -noded. Culm-internodes smooth or scaberulous. Leaf-sheaths antrorsely scabrous. Ligule an eciliate membrane, 2–3 mm long, lacerate, obtuse. Leaf-blades filiform, involute, 2–8 cm long, 0.5 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, effuse, 2–15 cm long, with spikelets clustered towards branch tips. Primary panicle branches spreading, whorled at most nodes, branching divaricately. Panicle axis scaberulous (above). Panicle branches capillary, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–6 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Spikelet callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 2.5–4 mm long, 1.1–1.2 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume margins ciliolate. Lower glume apex acute. Upper glume lanceolate, 2–3.7 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume margins ciliolate. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.5–3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex entire or dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1–0.5 way up back of lemma, straight or geniculate, 3–6 mm long overall, without a column or with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.2–0.3 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, A.C.T., South Australia, Tasmania, Victoria, Western Australia.

Tablelands, Western Slopes.

Agrostis vidalii Sennen, nom nud. *Bull. Soc. Bot. France*, 74: 406. (1927).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Chile, Rio Puelo: Vidal (SGO holo, BAA, K).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina 3 – 2 Pooideae* (2012) (124), M.N.Correa, *Flora Patagonica Parte III, Gramineae* (1978) (372, Fig. 248).

Derivation (Clifford & Bostock 2007): in honor of Francesco Vidal Gormaz, Chilean Army Officer.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, 20–60 cm long. Culm-nodes brown or purple, glabrous. Leaf-sheaths 2–14 cm long, smooth or scaberulous. Ligule an eciliate membrane, 2–3.5 mm long, erose, obtuse. Leaf-blades 2–11 cm long, 2–3 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, 6–15 cm long. Panicle axis smooth or with occasional prickles. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, hairy in 2 tufts.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 3–4 mm long, 1.5–1.6 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma surface scaberulous, rough on veins. Lemma apex awned, 1 -awned. Principal lemma awn dorsal, arising 0.75 way up back of lemma, 0.5 mm long overall. Palea 1.1–1.5 mm long, hyaline.

Flower and Fruit. Lodicules 2, 0.6–0.8 mm long, membranous. Anthers 3, 1.5 mm long. Caryopsis with adherent pericarp, 1.2–1.6 mm long. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Chile South.

Recent Synonyms: *Agrostis planifolia* C.Koch, *Linnaea*, 21: 380 (1848). *Agrostis trinii* Turcz., *Bull. Soc. Nat. Mosc.* 19, 1: 18 (1856).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina 3 – 2 Pooideae* (2012) (125), T. Cope & A. Gray, *Grasses of the British Isles* (95), H.J.Noltie, *The Grasses of Bhutan* (2000) (605, Fig. 26), M.E.Barkworth et al, *Flora of North America north of Mexico Vol 24 Poaceae*, part 1 (2007) (645).

Derivation (Clifford & Bostock 2007): *L. vinea*, vineyard; *-alis*, pertaining to. Growing in vineyards.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms erect or geniculately ascending, 10–60 cm long. Ligule an eciliate membrane, 1–5 mm long, obtuse or acute. Leaf-

blades flat or convolute, 2–15 cm long, 1–3 mm wide. Leaf-blade surface scabrous, rough adaxially or on both sides.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, lanceolate or oblong or ovate, 2–20 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2–3.3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2–3.3 mm long, 1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth or scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 1.5–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex erose, truncate, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.4 way up back of lemma, geniculate, 2–4.5 mm long overall, with twisted column. Palea 0.5 mm long, hyaline, 2 -veined.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1–1.5 mm long. Stigmas 2, laterally exerted. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mexico, Toluca: Humboldt & Bonpland (P holo, LE).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. viresco*, become green. Panicle shiny-green.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 40–80 cm long, 2–3 -noded. Leaves basal and cauline. Ligule an eciliate membrane, 4–6 mm long. Leaf-blades 9–22 cm long, 2–4 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 17–20 cm long, 1 cm wide. Primary panicle branches ascending, rebranched below middle. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.9–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous or sparsely hairy.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, gaping. Lower glume oblong, 2.9–3.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume oblong, 2.9–3.5 mm long, 1.8 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma ovate, 1.6–2 mm long, hyaline, without keel. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.66 way up back of lemma, geniculate, 1.5–3 mm long overall, clearly exerted from spikelet, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.6–0.7 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Central Mexico. Mesoamerica, Western South America. Costa Rica, Panama. Ecuador, Peru.
Mexico State.

Agrostis volkensis Stapf. *Kew Bull.* 1897, 289. (1897).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Tanzania. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Tanzania, Kilimanjaro: *Volkens 1856* (K holotype).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Georg Ludwig August Volkens (1855–1917) German botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 6–45 cm long. Ligule an eciliate membrane. Leaf-blades filiform, involute, 5–10 cm long, 1 mm wide, stiff. Leaf-blade venation without layer of subepidermal sclerenchyma masking vein striation or with continuous uniform subepidermal sclerenchyma layer on the underside. Leaf-blade surface scabrous, rough abaxially.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 2–10 cm long. Panicle branches flexuous, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 2–4.5 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scaberulous. Lower glume surface asperulous. Lower glume apex acute. Upper glume lanceolate, 2–4.5 mm long, 1–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume surface asperulous. Upper glume apex acute.

Florets. Fertile lemma ovate, 2–3 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma surface glabrous or pilose. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 3–5 mm long overall, with twisted column. Palea 1 length of lemma, hyaline, 2 -veined. Palea apex with excurrent keel veins. Rhachilla extension 0.05–0.1 length of fertile floret.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Caryopsis with adherent pericarp. Hilum linear. Endosperm farinose.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa, East Tropical Africa. Ethiopia (inc. Eritrea). Kenya, Tanzania, Uganda.

Agrostis wacei C.E.Hubb. *Bull. Brit. Mus. (Nat. Hist.), Bot.*, 8(4): 383 (1981).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Tristan da Cunha. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Tristan da Cunha: Wace T-319 (K holo, BM).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Nigel Morritt Wace (1929–2005) English-born Australian botanist and geographer.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, cushion forming, clumped densely. Culms slender, 10–20 cm long. Culm-internodes terete, smooth, distally glabrous. Lateral branches sparse. Leaf-sheaths longer than adjacent culm internode, ribbed, scaberulous, glabrous on surface. Ligule an eciliate membrane, 0.5–1 mm long. Leaf-blades straight or curved, aciculate, involute, 1–1.5 cm long, 0.5 mm wide, stiff. Leaf-blade surface ribbed, grooved adaxially, scaberulous, rough adaxially. Leaf-blade apex obtuse.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1–4 fertile spikelets, shorter than basal leaves. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 1–1.5 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 1.6–2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, with lower wider than upper, exceeding apex of florets, firmer than fertile lemma, parallel to lemmas or gaping. Lower glume lanceolate, 1.6–2 mm long, 1–1.1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scaberulous. Lower glume surface asperulous. Lower glume apex obtuse or acute. Upper glume lanceolate, 1.6–2 mm long, membranous, 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume surface asperulous. Upper glume apex acute.

Florets. Fertile lemma elliptic, 1.2–1.4 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma apex dentate, 5 -fid, truncate. Palea oblong, 1 mm long, 0.6–0.8 length of lemma, hyaline, 2 -veined. Palea apex obtuse.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Antarctica.

Country /Province /State. Subantarctic islands. Tristan de Cunha.

Agrostis wardii Bor. *Kew Bull.* 1949: 444 (1949).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Manipur, Sirhoi Kashong: *Kingdon-Ward 18145* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Francis Kingdon-Ward (1885–1958) English botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 30–60 cm long. Culm-nodes glabrous. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane. Leaf-blades 15–25 cm long, 4–8 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 7–14 cm long, 1–2.5 cm wide. Primary panicle branches whorled at most nodes, 3–6 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny, gaping. Lower glume lanceolate, 3–3.5 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute.

Upper glume ovate, 2.7–3.1 mm long, 1.3 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 2–2.5 mm long, hyaline, without keel, 5 -veined, more than 3-veined. Lemma lateral veins excurrent. Lemma margins ciliate. Lemma apex dentate, 4 -fid, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 6 mm long overall, with twisted column. Column of lemma awn 2 mm long. Palea 2 mm long, 0.8–1 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. Assam. Manipur.

Agrostopoa barclayae Davidse, Soreng & P.M.Peterson. *Novon* 19: 36 (2009).

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Magdalena: Sierra Nevada de Santa Marta, alrededores de cabeceras de R? Sevilla, 3490 m, 20 Jan 1959, H.G. Barclay & P. Juajibioy 6567 (HT: MO-5114991; IT: COL, US-2434406, US).

Illustrations (Journals): *Novon* (19:37, Fig 2 (2009)).

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Butt sheaths persistent and investing base of culm, with soft dead sheaths. Culms erect or geniculately ascending, 11–29 cm long, 3–10 -noded, without nodal roots or rooting from lower nodes. Culm-internodes smooth. Leaves basal and cauline. Leaf-sheaths open for most of their length. Ligule an eciliate membrane, 1–3.1 mm long, erose. Leaf-blades flat or involute, 1.5–5 cm long, 0.3–0.5 mm wide. Leaf-blade surface smooth, glabrous.

Inflorescence. Inflorescence a panicle, comprising 5–20(–30) fertile spikelets. Panicle open, oblong, 2–4 cm long. Primary panicle branches spreading, bearing 1–3 fertile spikelets on each lower branch. Panicle axis 2–4 noded. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 0.7–4 mm long, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3–10 mm long, with hairs extending (3.5–)4–4.5 mm beyond apex, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, reaching apex of florets. Lower glume lanceolate, (2.8–)3.4–4.4 mm long, 0.8–1 length of upper glume, membranous, much thinner on margins, 1-keeled, 1 -veined or 3 -veined. Lower glume primary vein scaberulous (above). Lower glume lateral veins absent or distinct. Lower glume apex acute. Upper glume lanceolate, (3.2–)4–4.4 mm long, 1 length of adjacent fertile lemma, membranous, with hyaline margins, 1-keeled, 1 -veined or 3 -veined. Upper glume primary vein scaberulous (above). Upper glume lateral veins absent or distinct. Upper glume apex acute.

Florets. Fertile lemma ovate, 4–4.5 mm long, membranous, much thinner above, keeled, 5 -veined, more than 3-veined. Lemma midvein scaberulous (above). Lemma lateral veins obscure. Lemma surface papillose. Lemma apex entire or dentate, 3 -fid, with lobes 0.2 mm long, acute, awned, 1 -awned. Principal lemma awn apical or from a sinus, straight or curved or flexuous, 2–5.2 mm long overall. Palea 1 length of lemma. Palea keels 0.25 mm apart, scabrous, adorned above.

Flower and Fruit. Lodicules 2, lanceolate, 0.5 mm long, veinless, acute. Anthers 3, 2.1–2.7 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Agrostopoa wallisii (Mez) P.M.Peterson, Soreng & Davidse. *Novon* 19: 34 (2009).

TYPE from Colombia. **Basionym or Replaced Name:** *Muhlenbergia wallisii* Mez, Spec. Nov. Regni. Veg. 17: 214 (1921). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *G. Wallis*, Colombia: Sierra Nevada de Santa Marta (US-90978 (fragm. ex B); IT: US-90979 (fragm. ex B)). LT designated by Davidse, Soreng & P.M. Peterson, *Novon* 19(1): 34 (2009).

Illustrations (Journals): *Novon* (19:35, Fig 1 (2009)).

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, slender, 7–15 cm long, 6–8 -noded. Culm-internodes smooth, distally glabrous. Lateral branches ample, arising from lower culm. Leaves mostly basal. Leaf-sheaths loose, open for most of their length, smooth. Ligule an eciliate membrane, 0.8–3.5 mm long, entire or erose, acute. Leaf-blades flat or involute, 0.8–2.5 cm long, 0.3 mm wide. Leaf-blade surface smooth, glabrous.

Inflorescence. Inflorescence a panicle, comprising 5–15 fertile spikelets, embraced at base by subtending leaf. Panicle open, oblong, 1–3.5 cm long, bearing few spikelets. Primary panicle branches 1–4-nate, 1–1.5 cm long. Panicle axis 3–5 noded. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 0.4–3 mm long, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3–10 mm long, with hairs extending 2.4–3.9 mm beyond apex, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets. Lower glume lanceolate, 2.3–2.6 mm long, 0.66–0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 2.4–3.9 mm long, 1.1–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma ovate, 2.1–3 mm long, membranous, much thinner above, keeled, 5 -veined, more than 3-veined. Lemma midvein scaberulous (above). Lemma lateral veins obscure. Lemma apex acute, awned, 1 -awned. Principal lemma awn apical, 2.5–5.2 mm long overall, without a column (but loosely twisted). Palea 1 length of lemma. Palea keels 0.2 mm apart, smooth.

Flower and Fruit. Lodicules 2, 0.3 mm long. Anthers 3, 1.6–2.1 mm long. Caryopsis with adherent pericarp, 1.5 mm long, dark brown.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Agrostopoa woodii Davidse, Soreng & P.M.Peterson. *Novon* 19: 38 (2009).

Illustrations (Journals): *Novon* (19:39, Fig 3 (2009)).

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Culms erect or geniculately ascending, 15–20 cm long, 2–3 -noded, without nodal roots or rooting from lower nodes. Leaves basal and cauline. Leaf-sheaths open for most of their length, with 0.25 of their length closed, 4 cm long. Ligule an eciliate membrane, 0.5–2.5 mm long, lacerate. Leaf-blades flat or conduplicate or involute, 1.5–4.5 cm long, 0.5–0.8 mm wide. Leaf-blade surface smooth, glabrous. Leaf-blade apex abruptly acute, hooded.

Inflorescence. Inflorescence a panicle, comprising 8–11 fertile spikelets. Panicle open, oblong, 2–3 cm long, bearing few spikelets. Primary panicle branches spreading, 1–3 -nate, 0.4–0.6(–1) cm long, bearing 1 fertile spikelets on each lower branch. Panicle axis 3–5 noded. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3–10 mm long, with hairs extending 4.5–5.6 mm beyond apex, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets. Lower glume lanceolate, 4.4–5.6 mm long, 1 length of upper glume, membranous, much thinner on margins, 1-keeled, 1 -veined or 3 -veined. Lower glume primary vein scaberulous (above). Lower glume lateral veins absent or distinct. Lower glume apex acute. Upper glume lanceolate, 4.7–5.6 mm long, 1.3 length of adjacent fertile lemma, membranous, with hyaline margins, 1-keeled, 1 -veined or 3 -veined. Upper glume primary vein scaberulous (above). Upper glume lateral veins absent or distinct. Upper glume apex acute.

Florets. Fertile lemma ovate, 3.7–4.5 mm long, membranous, much thinner above, keeled, 5 -veined, more than 3-veined. Lemma midvein scaberulous (above). Lemma lateral veins obscure. Lemma surface

papillose. Lemma apex entire or dentate, 3-fid, with lobes 0.1 mm long, acute, mucronate, 1-awned. Principal lemma awn apical or from a sinus, 0.2–0.6 mm long overall. Palea 0.9 length of lemma. Palea keels 0.25 mm apart, scaberulous, adorned above.

Flower and Fruit. Lodicules 2, 0.7 mm long. Anthers 2 (rarely) or 3, 1.7–2.2 mm long. Caryopsis with adherent pericarp, fusiform, 2 mm long, light brown.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Aira caryophyllea L. *Sp. Pl.* 66. (1753).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983), W.D.Clayton & N.Snow, *Key to Pacific Grasses* (2010).

Derivation (Clifford & Bostock 2007): foliage resembling that of *Dianthus caryophyllus*.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 3–40(–55) cm long, 2–3-noded. Leaves mostly basal. Ligule an eciliate membrane, 2–5 mm long, erose, obtuse. Leaf-blades filiform, involute, 0.5–5 cm long, 0.3–1 mm wide. Leaf-blade surface scaberulous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 1–12 cm long, (2–)3.5–10(–14) cm wide. Panicle branches capillary, terete, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 1–10 mm long, tip pyriform.

Fertile Spikelets. Spikelets comprising 2 fertile florets, without rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong to ovate, laterally compressed, 2.4–3.1 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes suppressed between florets (florets arising at about the same level). Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume ovate, 2.4–3.1 mm long, 1 length of upper glume, membranous, 1-keeled, keeled above, 1–3-veined. Lower glume primary vein scaberulous. Lower glume apex acute. Upper glume ovate, 2.4–3.1 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, keeled above, 1–3-veined. Upper glume primary vein scaberulous. Upper glume apex acute.

Florets. Fertile lemma ovate, laterally compressed, lanceolate in profile, (1.8–)2–2.4(–2.6) mm long, cartilaginous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface scaberulous, rough above. Lemma margins involute, covering most of palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.3–0.4 way up back of lemma, geniculate, 2.6–3.6 mm long overall, with twisted column. Palea elliptic, 0.7 length of lemma, cartilaginous, 2 -veined. Palea apex obtuse.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 0.25–0.6 mm long. Stigmas 2, protandrous, laterally exerted. Caryopsis with adherent pericarp, fusiform, isodiametric, biconvex, estipitate, without sulcus, 1 mm long, smooth, apex unappendaged. Embryo 0.2 length of caryopsis. Hilum punctiform. Endosperm farinose.

Derivation (Clifford & Bostock 2007): L. -ana, indicating connection. In honor of Francesco Cupani (1657–1780). Italian botanist, cleric and physician.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, 10–35 cm long, 2–3-noded. Leaves mostly basal. Ligule an eciliate membrane, 1–5 mm long. Leaf-blades 1–6 cm long, 0.5–1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 2–12 cm long. Primary panicle branches ascending or spreading. Panicle branches flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, tip globular.

Fertile Spikelets. Spikelets comprising 2 fertile florets, without rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong to ovate, laterally compressed, 1.3–2.3 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes suppressed between florets (florets arising at about the same level). Floret callus pubescent.

Glumes. Glumes persistent, similar, reaching apex of florets or exceeding apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume ovate, 1.3–2.3 mm long, 1 length of upper glume, membranous, 1-keeled, keeled above, 1–3 -veined. Lower glume primary vein scaberulous. Lower glume apex obtuse. Upper glume ovate, 1.3–2.3 mm long, 1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, keeled above, 1–3 -veined. Upper glume primary vein scaberulous. Upper glume apex obtuse.

Florets. Fertile florets all alike or with the lowest dissimilar. Lowest fertile lemma muticous. Fertile lemma ovate, laterally compressed, lanceolate in profile, 1.3–2 mm long, cartilaginous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface scaberulous, rough above. Lemma margins involute, covering most of palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 1.8–2.5 mm long overall, with twisted column. Palea elliptic, 0.7 length of lemma, cartilaginous, 2 -veined. Palea apex obtuse.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 0.1–0.25 mm long. Stigmas 2, protandrous, laterally exerted. Caryopsis with adherent pericarp, fusiform, isodiametric, biconvex, estipitate, without sulcus, 1 mm long, smooth, apex unappendaged. Embryo 0.2 length of caryopsis. Hilum punctiform. Endosperm farinose.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): *L. elegans*, elegant; *-issima*, most. Very attractive in some respect, usually the inflorescence.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, slender, 10–40 cm long. Ligule an eciliate membrane, 2–3 mm long, acute. Leaf-blades filiform, flat or convolute, 2–4 cm long, 0.5–1 mm wide. Leaf-blade surface scaberulous, glabrous. Leaf-blade apex obtuse.

Inflorescence. Inflorescence a panicle. Panicle open, obovate, effuse, 4–9 cm long, 2–5 cm wide. Primary panicle branches branching dichotomously. Panicle branches capillary, terete, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 5–13 mm long, 2–5 length of fertile spikelet, tip pyriform.

Fertile Spikelets. Spikelets comprising 2 fertile florets, without rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 1.5–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes suppressed between florets (florets arising at about the same level). Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume ovate, 1.5–2.5 mm long, 1 length of upper glume, membranous, 1-keeled, keeled above, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume ovate, 1.5–2.5 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, keeled above, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile florets all alike or with the lowest dissimilar. Lowest fertile lemma muticous or awned. Fertile lemma ovate, laterally compressed, lanceolate in profile, 1.5 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface scabrous. Lemma margins involute, covering most of palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.3–0.4 way up back of lemma, geniculate, 1.5–2 mm long overall, clearly exerted from spikelet, with twisted column.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 0.3–0.5 mm long. Stigmas 2.

$2n = 5$ (5 refs TROPICOS).

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia, Australasia (*), North America, South America.

Images: D. Sharp & B.K. Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): L. early. Flowering early in the spring.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 2–25 cm long, 2–3 -noded. Leaves mostly basal. Ligule an eciliate membrane, 1.5–3.5 mm long, entire, obtuse. Leaf-blades filiform, involute, 0.5–5 cm long, 0.3–0.5 mm wide. Leaf-blade surface smooth or scaberulous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear or oblong, 0.5–4.5 cm long, 0.2–0.8 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, linear, terete, 1–3 mm long.

Fertile Spikelets. Spikelets comprising 2 fertile florets, without rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong to ovate, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes suppressed between florets (florets arising at about the same level). Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume ovate, 3–3.5 mm long, 1 length of upper glume, membranous, much thinner above, much thinner on margins, 1-keeled, keeled above, 1–3 -veined. Lower glume primary vein scaberulous. Lower glume apex acute. Upper glume ovate, 3–3.5 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, keeled above, 1–3 -veined. Upper glume primary vein scaberulous. Upper glume apex acute.

Florets. Fertile lemma ovate, laterally compressed, lanceolate in profile, 2.7–3.1 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface scaberulous, rough above. Lemma margins involute, covering most of palea. Lemma apex dentate, 3 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.3–0.4 way up back of lemma, geniculate, 3.4–4.3 mm long overall, with twisted column. Palea elliptic, 0.7 length of lemma, cartilaginous, 2 -veined. Palea apex obtuse.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 0.25–0.3 mm long. Stigmas 2, protandrous, laterally exerted. Caryopsis with adherent pericarp, fusiform, isodiametric, biconvex, stipitate, without sulcus, smooth, apex unappendaged. Embryo 0.2 length of caryopsis. Hilum punctiform. Endosperm farinose.

$n = 7$ (1 ref TROPICOS). $2n = 14$ (2 refs TROPICOS).

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia, Australasia (*), North America, South America, Antarctica.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): *L. provincia*, province; *-alis*, pertaining to. Relating to a province, in particular to Provincia, now Provence, France.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, slender, 10–40 cm long. Ligule an eciliate membrane, 2–3 mm long, acute. Leaf-blades filiform, flat or convolute, 2–4 cm long, 0.5–1 mm wide. Leaf-blade surface scaberulous, glabrous. Leaf-blade apex obtuse.

Inflorescence. Inflorescence a panicle. Panicle open, obovate, effuse, 4–9 cm long, 2–5 cm wide. Primary panicle branches branching dichotomously. Panicle branches capillary, terete, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 2–5 length of fertile spikelet, tip widened (gradually).

Fertile Spikelets. Spikelets comprising 2 fertile florets, without rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes suppressed between florets (florets arising at about the same level). Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume ovate, 3.5 mm long, 1 length of upper glume, membranous, 1-keeled, keeled above, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume ovate, 3.5 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, keeled above, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile florets with the lowest dissimilar. Lowest fertile lemma muticous or awned (shorter than upper). Fertile lemma ovate, laterally compressed, lanceolate in profile, 2.5 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface scabrous. Lemma margins involute, covering most of palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 2.5 mm long overall, clearly exerted from spikelet (upper) or not or scarcely exerted from spikelet (lower), with twisted column.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3. Stigmas 2.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Michele Tenore (1780–1861) Italian botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, slender, 10–40 cm long, 2–3 -noded. Leaves mostly basal. Leaf-sheaths scaberulous. Ligule an eciliate membrane, 2–3 mm long, acute. Leaf-blades flat or involute, 2–4 cm long, 0.4–0.8 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate or globose, effuse, 4–9 cm long, 2–5 cm wide. Primary panicle branches branching divaricately. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 5–8 length of fertile spikelet.

Fertile Spikelets. Spikelets comprising 2 fertile florets, without rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong to ovate, laterally compressed, 1.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes suppressed between florets (florets arising at about the same level). Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume ovate, 1.5–3 mm long, 1 length of upper glume, membranous, 1-keeled, keeled above, 1–3 -veined. Lower glume primary vein scaberulous. Lower glume apex entire or erose, obtuse, muticous or mucronate. Upper glume ovate, 1.5–3 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, keeled above, 1–3 -veined. Upper glume primary vein scaberulous. Upper glume apex obtuse, muticous or mucronate.

Florets. Fertile lemma ovate, laterally compressed, lanceolate in profile, 1.2–2.5 mm long, cartilaginous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface scaberulous, rough above. Lemma margins involute, covering most of palea. Lemma apex dentate, 2 -fid, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 2–3 mm long overall, with twisted column. Palea elliptic, 0.7 length of lemma, cartilaginous, 2 -veined. Palea apex obtuse.

Flower and Fruit. Lodicules 2, lanceolate, membranous. Anthers 3, 0.7–1.7 mm long. Stigmas 2, protandrous, laterally exerted. Caryopsis with adherent pericarp, fusiform, isodiametric, biconvex, estipitate, without sulcus, 1 mm long, smooth, apex unappendaged. Embryo 0.2 length of caryopsis. Hilum punctiform. Endosperm farinose.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. slender. Culms or inflorescence branches slender.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 3–20(–30) cm long. Ligule an eciliate membrane, 1–2 mm long, lacerate, obtuse. Leaf-blades convolute, 1–6 cm long, 0.5–1.5 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or oblong. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, tip pyriform.

Fertile Spikelets. Spikelets comprising 2 fertile florets, without rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets orbicular, laterally compressed, 1.2–1.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes suppressed between florets.

Glumes. Glumes persistent, similar, exceeding apex of florets, shiny. Lower glume orbicular, gibbous, 1.2–1.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume orbicular, gibbous, 1.2–1.5 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex obtuse.

Florets. Fertile lemma orbicular, gibbous, 1–1.3 mm long, membranous, shiny, without keel, 3 -veined, 0–3 -veined. Lemma margins pilose. Lemma apex obtuse.

Flower and Fruit. Anthers 3, 0.3 mm long. Ovary glabrous. Caryopsis with adherent pericarp, orbicular, dorsally compressed, plano-convex, 0.5 mm long. Endosperm farinose.

$n = 4$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Europe, Africa.

Region. Southwestern Europe, Southeastern Europe.

Illustrations (Journals): *Austrobaileya* 3(4): 671, Fig.1 (1992).

Derivation (Clifford & Bostock 2007): *L. repo*, crawl. Rhizome well developed.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Cenchrinae.

Habit, Vegetative Morphology. Perennial. Stolons present. Culms decumbent, 18–24 cm long, 3–4 -noded. Lateral branches sparse. Leaf-sheaths longer than adjacent culm internode. Ligule a fringe of hairs. Leaf-blades 0.5–6 cm long, 1–1.5 mm wide. Leaf-blade midrib conspicuous. Leaf-blade surface glabrous. Leaf-blade margins smooth.

Inflorescence. Inflorescence a panicle, comprising 3–6 fertile spikelets. Panicle contracted, linear, 1.5 cm long, bearing few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, terete, 4–7 mm long, smooth.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 3–3.5 mm long, 1.5 mm wide, falling entire.

Glumes. Glumes thinner than fertile lemma. Lower glume ovate, 2 mm long, 0.66 length of spikelet, chartaceous, 5–7 -veined. Lower glume apex acute. Upper glume elliptic, 3 mm long, 1 length of spikelet, chartaceous, without keels, 9 -veined. Upper glume lateral veins ribbed. Upper glume surface glabrous or pilose (sparsely in middle), with tubercle-based hairs. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret elliptic, 3 mm long, 1 length of spikelet, chartaceous, 9 -veined, ribbed, acute. Fertile lemma oblong, dorsally compressed, 1.5 mm long, cartilaginous, yellow, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure.

Lemma surface striate. Lemma margins flat. Lemma apex acute. Palea gaping, oblong, 1.5 mm long, cartilaginous.

Flower and Fruit. Lodicules 2, 0.5 mm long. Anthers 3, 2.5 mm long or 0.8 mm long (upper). Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales. Coast.

Alloochaete andongensis (Rendle) C. E. Hubbard. *Hook. Ic. Pl.* v. t. 3418 (1940).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Angola. **Basionym or Replaced Name:** *Danthonia andongensis* Rendle, *Cat. Welw. Afr. Pl.* 2: 212 (1899). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *Pungo Andongo 2744*, Africa: on the rocks of the praesidium

IT: *Pungo & Cabondo 7417*, Africa: on the higher rocks of the praesidium at Pedra Cazella.

Illustrations (Journals): *Hooker's Icones Plantarum* (t.3418 (1940)).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Pungo Andongo District, Angola.

Classification. Subfamily Arundinoideae. Tribe: Arundineae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped moderately. Butt sheaths coriaceous, glossy, woolly, persistent and investing base of culm, with fibrous dead sheaths. Culms erect, 30–60 cm long. Ligule a fringe of hairs, 0.8 mm long. Leaf-blades involute, 12–23 cm long, 3–6 mm wide. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 13–18 cm long. Primary panicle branches ascending, bearing spikelets almost to the base. Panicle branches puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 5–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 10–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 1 mm long. Floret callus obtuse.

Glumes. Glumes persistent, dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume oblong or ovate, 5–6.5 mm long, 1 length of upper glume, herbaceous, 1-keeled, 3 -veined. Lower glume apex acuminate, awned, 1 -awned, awn 0.5 mm long. Upper glume oblong or ovate, 5–6.5 mm long, 0.75 length of adjacent fertile lemma, herbaceous, 1-keeled, 3 -veined. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 0.5 mm long.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, lanceolate or ovate, 6 mm long, herbaceous, 5 -veined, dentate, 2 -fid, awned. Awn of lower sterile floret straight, 1 mm long. Fertile lemma elliptic, 6–7 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins absent or obscure below. Lemma surface with marginal hair tufts, bearing 2 hair tufts in all. Lemma apex lobed, 2 -fid, awned, 3 -awned. Principal lemma awn from a sinus, geniculate, 7–9 mm long overall, with twisted column. Lateral lemma awns present, arising on apex of lobes, shorter than principal. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, glabrous. Anthers 3, 3 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa. Angola.

Alloochaete geniculata Kabuye. *Kew Bull.* 30(3): 575 (1975).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Malawi. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mulanje: *Phipps 2769* (K holo, BM, SRGH).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. genus*, knee; *-ulus*, diminutive. *-ata*, possessing. Plants with bent culms or awns.

Classification. Subfamily Arundinoideae. Tribe: Arundineae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped moderately. Butt sheaths papery, woolly, persistent and investing base of culm, with fibrous dead sheaths. Culms 30–60 cm long. Ligule a fringe of hairs, 0.5–0.6 mm long. Leaf-blades convolute, 8–17 cm long, 2–3.5 mm wide. Leaf-blade surface pilose, sparsely hairy, hairy adaxially. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 15–25 cm long. Primary panicle branches 1–3 -nate. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 5–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 11–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume elliptic, 6–8 mm long, 1 length of upper glume, herbaceous, 1-keeled, 3 -veined. Lower glume apex acuminate, awned, 1 -awned, awn 0.5 mm long. Upper glume elliptic, 6–8 mm long, 1 length of adjacent fertile lemma, herbaceous, 1-keeled, 3–5 -veined. Upper glume apex dentate, 3 -fid, awned, 1 -awned, awn 0.5 mm long.

Florets. Basal sterile florets 1, male or barren (sometimes bisexual), with palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, lanceolate or ovate, 7–7.5 mm long, herbaceous, 5 -veined, eciliate on margins or ciliate on margins, dentate, 2 -fid, awned. Awn of lower sterile floret geniculate, 5–10 mm long. Palea of lower sterile floret 0.8 length of lemma, pubescent, adorned on keels. Fertile lemma elliptic, 6 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma surface with marginal hair tufts, bearing 2 hair tufts in all. Lemma hairs 1–1.3 mm long. Lemma apex lobed, 2 -fid, awned, 3 -awned. Principal lemma awn from a sinus, geniculate, with twisted column. Lateral lemma awns present, arising on apex of lobes, shorter than principal. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, glabrous. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa. Malawi.

Alloochaete gracillima Kabuye. Kew Bull., 30(3): 576 (1975).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Malawi. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mulanje, Chambe Plateau: *Jackson 2169* (K holo, SRGH).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L.* very delicate. Of slender habit.

Classification. Subfamily Arundinoideae. Tribe: Arundineae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped moderately. Butt sheaths thickened and forming a bulb, woolly, persistent and investing base of culm, with compacted dead sheaths. Culms 30–66 cm long. Leaf-sheath oral hairs ciliate, 2.5 mm long. Ligule a fringe of hairs, 0.2 mm long. Leaf-blades convolute, 15–30 cm long, 4–6 mm wide. Leaf-blade surface scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, 8–16 cm long. Primary panicle branches ascending, 1–3 -nate. Panicle branches scaberulous, rough distally. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 5–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear or lanceolate, laterally compressed, 8–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse.

Glumes. Glumes persistent, dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate or ovate, 4–6.3 mm long, 0.7–0.9 length of upper glume, herbaceous, 1-keeled, 1–3 -veined. Lower glume surface puberulous. Lower glume apex acuminate, muticous or awned, 1 -awned, awn 0.5 mm long. Upper glume lanceolate or ovate, 3.7–7 mm long, 0.8–0.9 length of adjacent fertile lemma,

herbaceous, 1-keeled, 3–5 -veined. Upper glume surface puberulous. Upper glume apex acuminate, mucicous or awned, 1 -awned, awn 0.5 mm long.

Florets. Fertile florets with the lowest dissimilar (hair tufts weaker). Fertile lemma elliptic, 7–8 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma surface with marginal hair tufts, bearing 2 hair tufts in all. Lemma apex lobed, 2 -fid, awned, 3 -awned. Principal lemma awn from a sinus, geniculate, 5–10 mm long overall, with twisted column. Lateral lemma awns present, arising on apex of lobes, shorter than principal. Palea 0.8 length of lemma. Palea keels ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, glabrous. Anthers 3, 1.8 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa. Malawi.

Alloochaete namuliensis Chippind. *Journ. S. Afr. Bot.* 11: 101 (1945).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Malawi. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Namuli Peaks: *Torre 5146* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Namuli Mountains, Mozambique.

Classification. Subfamily Arundinoideae. Tribe: Arundineae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped moderately. Butt sheaths thickened and forming a bulb, glossy, woolly, persistent and investing base of culm, with fibrous dead sheaths. Culms erect, 40–80 cm long. Ligule a fringe of hairs, 0.2 mm long. Leaf-blades flat or involute, 17–45 cm long, 3–6 mm wide. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 13–14.5 cm long. Primary panicle branches spreading, bearing spikelets almost to the base. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 3–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 6–7(–12) mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 0.5 mm long. Floret callus obtuse.

Glumes. Glumes persistent, dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate or ovate, 3–5 mm long, 1 length of upper glume, chartaceous, 1-keeled, 3 -veined. Lower glume surface glabrous or puberulous. Lower glume apex acuminate, mucicous. Upper glume lanceolate or ovate, 3–5 mm long, 0.75–0.8 length of adjacent fertile lemma, chartaceous, 1-keeled, 3–5 -veined. Upper glume surface glabrous or puberulous. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 0.5–1 mm long.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, lanceolate or ovate, 4 mm long, herbaceous, 5 -veined, puberulous, hairy above, dentate, 2 -fid, awned. Awn of lower sterile floret straight or flexuous (reflexed), 1 mm long. Fertile lemma elliptic, 4–6 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma surface glabrous or puberulous, hairy above, with marginal hair tufts, bearing 2 hair tufts in all. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn from a sinus, geniculate, 6 mm long overall, with twisted column. Lateral lemma awns present, arising on apex of lobes, shorter than principal. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, glabrous. Anthers 3, 2–3.3 mm long. Caryopsis 2.3 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa. Mozambique.

Alloochaete oreogena Launert. *Garcia de Orta, Sirie de Botbnica* 1(1–2): 91. 1973.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Malawi. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Mt. Mulanje, Likuleze Valley, 23.vi.1958, *Chapman 669* (BM, holo; K; SRGH).

Illustrations (Books): G.V.Pope et al., *Flora Zambesiaca* 10 (2(1999):10, T. 5), T.R.Soderstrom, K.W.Hilu, C.S.Campbell & M.E.Barkworth (246, Fig. 22.6).

Derivation (Clifford & Bostock 2007): Gk. *oros*, mountain; genea, birthplace. Mountain born, that is growing on mountains.

Classification. Subfamily Arundinoideae. Tribe: Arundineae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short (up to 12 mm diam). Butt sheaths papery, woolly, persistent and investing base of culm, with fibrous dead sheaths. Culms erect, 100–200 cm long. Ligule a fringe of hairs, 0.5–0.9 mm long. Leaf-blades 60–130 cm long, 10–20 mm wide. Leaf-blade apex hooded.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or oblong, dense, 23–42 cm long. Panicle branches pubescent in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, (3–)6–9 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 20–26 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 1.5 mm long. Floret callus elongated, 1.6–2 mm long, bearded, obtuse. Floret callus hairs 0.3 length of lemma.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume elliptic, 7–10 mm long, 0.75 length of upper glume, membranous, 1-keeled, (3–)5 -veined. Lower glume surface pilose, hairy above. Lower glume apex acuminate. Upper glume elliptic, 9–14 mm long, 0.9–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 5 -veined. Upper glume surface pilose, hairy above. Upper glume apex dentate, 2 -fid, awned, 1 -awned.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, elliptic, (11–)13–15 mm long, membranous, 5 -veined, pilose, hairy above, dentate, 2 -fid, awned. Awn of lower sterile floret straight, 1 mm long. Fertile lemma elliptic, 10 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pilose, hairy above, with marginal hair tufts, bearing 2 hair tufts in all. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn from a sinus, geniculate, 13–15 mm long overall, with twisted column. Lateral lemma awns present, arising on apex of lobes, 2–4 mm long, shorter than principal. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, glabrous. Anthers 3, 5–6 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa. Malawi.

Alloochaete ulugurensis Kabuye. *Kew Bulletin* 30(3): 537. 1975.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Tanzania. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Mzingi: *Pocs, Kondela & Nchimbi 6298c* (EA holo, K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From the Uluguru Mountains, Tanzania.

Classification. Subfamily Arundinoideae. Tribe: Arundineae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short (1–2mm diam). Butt sheaths indurate, glossy, woolly, persistent and investing base of culm, with compacted dead sheaths. Culms robust, 50–100 cm long. Ligule a fringe of hairs, 0.8 mm long. Leaf-blades deciduous at the ligule, linear or lanceolate, flat or convolute, 35–70 cm long, 4–8 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade apex acute, hooded.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate or oblong, 12–14 cm long, 5–6 cm wide. Primary panicle branches ascending. Panicle branches angular, smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 5–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear or lanceolate, laterally compressed, 8–9 mm long,

breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse. Floret callus hairs 1.5 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume elliptic, 3–3.5 mm long, 0.8–0.9 length of upper glume, herbaceous, 1-keeled, 3–5 -veined. Lower glume surface puberulous. Lower glume apex obtuse or acute, awned, 1 -awned, awn 0.5 mm long. Upper glume elliptic, 3.5–4 mm long, 0.75 length of adjacent fertile lemma, herbaceous, 1-keeled, 3–5 -veined. Upper glume surface puberulous. Upper glume apex obtuse or acute, awned, 1 -awned, awn 0.5 mm long.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, lanceolate or ovate, 4.5 mm long, herbaceous, 5 -veined, dentate, 2 -fid, awned. Awn of lower sterile floret straight, 1 mm long. Palea of lower sterile floret 0.66 length of lemma, pubescent, adorned on keels. Fertile lemma elliptic, 4.5 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma surface glabrous or puberulous, hairy above, without hair tufts. Lemma apex lobed, 2 -fid, awned, 3 -awned. Principal lemma awn from a sinus, curved, reflexed, 6 mm long overall, without a column. Lateral lemma awns present, arising on apex of lobes, shorter than principal. Palea 0.75–0.8 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, glabrous. Anthers 3, 0.8–1 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. East Tropical Africa. Tanzania.

Allolepis texana (Vasey) Soderstr. & H. F. Decker. *Madrono* 18: 34 (1965).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Poa texana* Vasey, *Contrib. U. S. Nat. Herb.* 2: 60 (1890). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *G.C. Nealley 1078*, 1887, USA: Texas: El Paso Co. (US-81565).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (29).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating location. From Texas, USA.

Classification. Subfamily Chloridoideae. Tribe: Eragrostideae.

Habit, Vegetative Morphology. Perennial. Stolons present. Culms geniculately ascending, 25–65 cm long. Ligule a ciliate membrane, 0.5–1.4 mm long. Leaf-blades flat or conduplicate, 15–30 cm long, 2.5–6 mm wide. Leaf-blade margins scabrous. Dioecious.

Inflorescence. Inflorescence composed of racemes. Racemes 5–9, borne along a central axis, ascending or appressed, paucilateral, 1–6 cm long. Central inflorescence axis 5–20 cm long. Rhachis angular. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 8–9 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 10–20 mm long, 2.5–3.5 mm wide, falling entire.

Glumes. Glumes similar, shorter than spikelet. Lower glume ovate, 7–9 mm long, 0.9 length of upper glume, coriaceous, much thinner on margins, without keels, 5–7 -veined. Lower glume primary vein scabrous. Lower glume apex acute. Upper glume ovate, 7.5–10 mm long, 1 length of adjacent fertile lemma, coriaceous, without keels, 3(–7) -veined. Upper glume primary vein scabrous. Upper glume apex acute.

Florets. Fertile florets female. Fertile lemma ovate, 7.5–10 mm long, coriaceous, much thinner on margins, without keel, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma apex acute. Palea tightly convolute around flower, bowed outwards, 0.9 length of lemma, coriaceous, 2 -veined. Palea keels winged, narrowly winged, ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 3, 3–3.5 mm long.

Male inflorescence similar to female, of racemes along a central axis. Male spikelets similar to female but less developed, 4–14 flowered, persistent, lanceolate, 9–23 mm long. Male spikelet glumes 2. Male spikelet lemma 3 -veined, muticous.

Distribution (TDWG). Continent. North America.

Country /Province /State. South-central USA, Mexico. Texas. Northeast Mexico.

Coahuila.

Alloteropsis angusta Stapf. Prain, *Fl. Trop. Afr.* 9: 485 (1919).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Angola. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Benguella: *Gosswailer* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. narrow. Narrow, with respect to leaf-blades or spicate panicles.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Perennial. Butt sheaths herbaceous, glabrous or pubescent. Culms decumbent, slender, 50–100 cm long, wiry. Ligule a fringe of hairs. Leaf-blades convolute, 5–15 cm long, 1–2 mm wide.

Inflorescence. Inflorescence composed of racemes. Racemes 2–3, digitate, unilateral, 4–13 cm long. Rhachis angular. Spikelet packing lax, irregular. Raceme-bases brief or filiform. Spikelets in pairs or clustered at each node. Fertile spikelets pedicelled, 2–4 in the cluster. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension or with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, 2.5–4 mm long, falling entire.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.33 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume margins ciliate. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret ovate, 1 length of spikelet, membranous, fenestrate (at base), 5 -veined, acuminate. Fertile lemma oblong, 2–3.5 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma margins involute. Lemma apex acuminate, awned, 1 -awned. Principal lemma awn 0.5–1 mm long overall. Palea chartaceous. Palea surface smooth, pubescent.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, East Tropical Africa, South Tropical Africa. Nigeria. Kenya, Uganda. Angola, Zambia, Zimbabwe.

Alloteropsis cimicina (L.) Stapf. Prain, *Fl. Trop. Afr.* 9: 487 (1919).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*), N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960).

(326, fig.75 as *Axonopus maidenianus*), G.G.Potgar, C.B.Salunkhe & S.R.Yadav, Grasses of Maharashtra (2012)

(Pl. 11).

Derivation (Clifford & Bostock 2007): L. cimex, bug; -ina, resemblance. Mature spikelets bear a fanciful resemblance to a small bug.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, 30–120 cm long. Culm-nodes bearded. Leaf-sheaths loose, open for most of their length, with flat margins, 1.5–12 cm long, without keel, striately veined, hirsute, with tubercle-based hairs. Ligule a fringe of hairs. Leaf-blade base amplexicaul. Leaf-blades lanceolate or ovate, 3–15 cm long, 5–20 mm wide. Leaf-blade midrib evident, prominent beneath. Leaf-blade venation distinct. Leaf-blade surface ribbed, glabrous (except midrib). Leaf-blade margins tuberculate-ciliate. Leaf-blade apex acute, simple.

Inflorescence. Inflorescence composed of racemes. Racemes 4–11, digitate or borne along a central axis (then corymbose and only lowest node whorled), unilateral, 7–25 cm long. Central inflorescence axis 0–10 cm long, puberulous. Rhachis angular, scabrous on surface. Spikelet packing irregular. Raceme-bases filiform (0.2–0.5 of raceme), 10–30 mm long, pilose, hairy at base. Spikelets ascending, in pairs or clustered at each node. Fertile spikelets pedicelled, 2–4 in the cluster. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension or with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, 3.5–5.5 mm long, falling entire.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5–0.75 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex acuminate. Upper glume ovate, 1 length of spikelet, cartilaginous, without keels, 5 -veined. Upper glume margins ciliate (hairs 1–2mm). Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret ovate, 1 length of spikelet, membranous, fenestrate (at base), 5 -veined, acuminate. Fertile lemma oblong or ovate, 3–5 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma margins involute. Lemma apex acuminate, awned, 1 -awned. Principal lemma awn 2–4.5 mm long overall. Palea 1 length of lemma, chartaceous. Palea surface papillose, glabrous. Palea apex entire.

Flower and Fruit. Anthers 3, linear, 0.5–1 mm long, anther tip smooth. Stigmas purple. Styles 0.5–1 mm long. Ovary glabrous. Caryopsis ovoid, laterally compressed.

$n = 18$ (1 ref TROPICOS).

Distribution (TDWG). **Continent.** Africa, Temperate Asia, Tropical Asia, Australasia, North America (*), South America.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa, Western Indian Ocean. Nigeria. Madagascar. **China.** Hainan. **Indian Subcontinent, Indo-China, Malesia, Papuasia.** Assam, India, Pakistan, Sri Lanka, West Himalaya. Andaman Is, Cambodia, Myanmar, Nicobar Is, Thailand. Borneo, Java, Lesser Sunda Is, Malaya, Singapore, Philippines, Sumatra. New Guinea PNG. New Guinea. **Australia.** Northern Territory, Queensland. **Southeastern USA.** Florida, Maryland. **Caribbean.** Cuba, Jamaica (as *Panicum fasciculatum*), Windward Islands (as *Panicum fasciculatum*).

Tripura. Andhra Pradesh, Delhi, Diu, Daman, Goa, Gujarat, Kerala, Karnataka. Madhya Pradesh, Maharashtra, Rajasthan, Tamilnadu, West Bengal. Darwin & Gulf. North, Central, Inland.

Alloteropsis paniculata (Benth.) Stapf. Prain, *Fl. Trop. Afr.* 9: 486 (1919).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Nigeria. **Basionym or Replaced Name:** *Urochloa paniculata* Benth., Hook. *Niger Fl.* 558. (1849). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Ansell s.n.*, At the confluence of the Niger on Stirling Hill, Nigeria (K).

Illustrations (Books): H.Jacques-Felix, *Les Graminees d'Afrique tropicale* (1962) (233, Fig. 158), J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (347, Fig. 130).

Derivation (Clifford & Bostock 2007): *L. panus*, thread; *-ula*, diminutive; *-ata*, possessing. Inflorescence open with thread-like pedicels.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending or decumbent, 60–150 cm long. Culm-nodes glabrous. Ligule a fringe of hairs. Leaf-blade base broadly rounded. Leaf-blades lanceolate, 4–12 cm long, 8–20 mm wide. Leaf-blade margins glabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 8–25, digitate, in several whorls, unilateral, 9–20 cm long. Rhachis angular. Spikelet packing irregular. Raceme-bases brief. Spikelets in pairs or clustered at each node. Fertile spikelets pedicelled, 2–6 in the cluster. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension or with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 3.5–4.5 mm long, falling entire.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.33–0.5 length of spikelet, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume ovate, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume margins ciliate (hairs 0.5mm). Upper glume apex acute or acuminate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret ovate, 1 length of spikelet, membranous, 5 -veined, acuminate. Fertile lemma oblong, 3–4 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma margins involute. Lemma apex acuminate, awned, 1 -awned. Principal lemma awn 2.5–7 mm long overall. Palea chartaceous. Palea surface smooth, glabrous.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, East Tropical Africa, South Tropical Africa, Western Indian Ocean. Ghana, Guinea, Ivory Coast, Liberia, Mali, Nigeria, Sierre Leone. DRC. Tanzania. Angola, Mozambique. Mauritius, Madagascar.

Alloteropsis papillosa W.D.Clayton. *Kew Bull.* 33(1): 21 (1978).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Derivation (Clifford & Bostock 2007): *L. semi*, half; *ala*, wing; *-ata*, possessing; Upper glumes winged.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short, woody. Butt sheaths thickened and forming a bulb (base at times flabellate), pubescent or woolly. Culms erect or geniculately ascending, 20–150 cm long. Culm-internodes eglandular, ridged, smooth, distally glabrous. Culm-nodes bearded. Lateral branches lacking. Leaves basal and cauline. Leaf-sheaths loose, open for most of their length, with flat margins, 2–15 cm long, longer than adjacent culm internode, wider than blade at the collar, without keel, striately veined, glabrous on surface or woolly, with simple hairs or tubercle-based hairs, outer margin hairy. Leaf-sheath oral hairs bearded. Ligule a ciliate membrane (ca 0.75mm) or a fringe of hairs. Collar glabrous or pubescent. Leaf-blade base tapering to the midrib or simple (rarely). Leaf-blades flat or convolute, 10–50 cm long, 1–10 mm wide, light green or glaucous. Leaf-blade midrib evident, prominent beneath. Leaf-blade venation distinct. Leaf-blade surface scabrous, rough on both sides, glabrous or hirsute, hairy on both sides, with tubercle-based hairs. Leaf-blade margins glabrous or tuberculate-ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 2–4(–8), digitate, unilateral, 2–22 cm long. Rhachis angular, with scattered hairs (rarely) or villous on surface. Spikelet packing irregular. Spikelets solitary (rarely) or in pairs or clustered at each node. Fertile spikelets pedicelled, 2–4 in the cluster. Pedicels present, angular, ciliate or villous, hairy all along but hairs longer above, tip cupuliform.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension or with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, 4–7.5 mm long, falling entire.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5–0.7 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex acuminate. Upper

glume ovate, 1 length of spikelet, membranous, light green (rarely with transverse purple bands), without keels, 5 -veined. Upper glume surface puberulous. Upper glume margins ciliate. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret ovate, 1 length of spikelet, chartaceous, fenestrate (at base), 5 -veined, truncate. Fertile lemma lanceolate, 3.5–7 mm long, chartaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma margins involute, ciliate. Lemma apex acuminate, awned, 1 -awned. Principal lemma awn 1.5–3 mm long overall. Palea chartaceous. Palea surface smooth, pubescent. Rhachilla extension 0–0.1 length of fertile floret.

Flower and Fruit. Lodicules 2, cuneate. Anthers 2 or 3, 0.3 mm long, brown. Stigmas yellow or purple. Styles 0.3 mm long. Ovary glabrous. Caryopsis ovoid, 1.3–1.5 mm long.

Derivation (Clifford & Bostock 2007): *L. aequus*, equal; *-alis*, pertaining to. Glumes or lemmas similar in length.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual or perennial, short-lived. Culms decumbent, 10–35 cm long, without nodal roots or rooting from lower nodes. Ligule an eciliate membrane, 2–5 mm long. Leaf-blades 2–10 cm long, 2–5 mm wide. Leaf-blade surface scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 1–5 cm long, 0.3–0.6 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic or oblong, laterally compressed, 2–2.5 mm long, falling entire.

Glumes. Glumes connate along margins below, similar, reaching apex of florets. Lower glume oblong, 2–2.5 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pubescent. Lower glume apex obtuse. Upper glume oblong, 2–2.5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pubescent. Upper glume apex obtuse.

Florets. Fertile lemma elliptic, 2–2.5 mm long, membranous, keeled, 4 -veined, more than 3-veined. Lemma margins connate below. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.35–0.45 way up back of lemma, 1–1.5 mm long overall, not or scarcely exerted from spikelet. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 1–1.3 mm long. Stigmas protogynous, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mt. Adzituko: *Albov 17* (LE holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Nicolas Mikhailowitch Alboff (1866–1897) Russian tobanist and traveller.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, culms solitary. Rhizomes short. Butt sheaths herbaceous, glabrous. Culms 10–30 cm long. Ligule an eciliate membrane, 0.3–0.7 mm long. Leaf-blades 1.5–4 mm wide. Leaf-blade surface smooth to scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath, embraced at base by subtending leaf. Panicle spiciform, elliptic, 0.9–1.8 cm long, 0.6–1.1 cm wide. Panicle branches pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.5–5 mm long, falling entire.

Glumes. Glumes similar, exceeding apex of florets. Lower glume oblong, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pubescent. Lower glume apex acute, awned, 1 -awned, awn 0.7–1.5 mm long. Upper glume oblong, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pubescent. Upper glume apex acute, awned, 1 -awned, awn 0.7–1.5 mm long.

Florets. Fertile lemma ovate, 2–3 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins ciliate, hairy above. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25–0.33 way up back of lemma, curved, 3.5–6 mm long overall, clearly exerted from spikelet. Palea 0.5 length of lemma.

Flower and Fruit. Lodicules absent. Anthers 3, 1.3–2 mm long. Stigmas protogynous, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Caucasus. North Caucasus.

Alopecurus anatolicus M. Dogan. *Notes Roy. Bot. Gard. Edinburgh* 45(1): 114 (1988).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Turkey. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Turkey, Sivas to Tatlica: Tobey 1679 (E holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ica*, belonging to. From Anatolia, Turkey.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, 15–33 cm long, 2 -noded. Culm-internodes smooth, distally glabrous. Leaf-sheaths glabrous on surface or puberulous, outer margin hairy (below). Ligule an eciliate membrane, 2–4 mm long, obtuse. Leaf-blades 2–6 cm long, 2–6 mm wide, glaucous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform, oblong, 2.5–3 cm long, 0.7–1 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 5–7 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.15 of their length connate, similar, exceeding apex of florets, recurved at apex. Lower glume lanceolate, 5–7 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume apex acuminate. Upper glume lanceolate, 5–7 mm long, 1.2–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume apex acuminate.

Florets. Fertile lemma ovate, 4–5 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below, with 0.5 of their length connate. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight or curved, 5–6.5 mm long overall, with a straight or slightly twisted column. Palea 3 mm long, 1 -veined.

Flower and Fruit. Lodicules absent. Anthers 3, 3 mm long, yellow.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Western Asia. Turkey.

Alopecurus apiatus Ovczinn. Komarov, *Fl. URSS* 2: 146, 744 (1934).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ary-Tasch: *Alexeenkov 1355* (LE holo).

Illustrations (Books): N.L.Bor, *Gramineae in Flora of Iraq* (1968) (296, Pl. 106).

Derivation (Clifford & Bostock 2007): *L. crisped*. Inflorescence invested in curly hairs which turn red at maturity.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms erect, 30–60 cm long. Culm-internodes glaucous. Ligule an eciliate membrane. Leaf-blades 7–15 cm long, 2–6 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform, linear, 1.5–4 cm long, 0.8–1.1 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 4.5–5 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.2–0.25 of their length connate, similar, reaching apex of florets, recurved at apex. Lower glume lanceolate, 4.5–5 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pilose. Lower glume apex acute. Upper glume elliptic, 4.5–5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pilose. Upper glume apex acute.

Florets. Fertile lemma oblong, 4.5–5 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma surface puberulous, hairy above. Lemma margins connate below. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 8–9 mm long overall, clearly exerted from spikelet, with twisted column.

Flower and Fruit. Lodicules absent. Anthers 3. Stigmas terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Middle Asia, Western Asia. Turkmenistan. Iran, Iraq.

Alopecurus arundinaceus Poir. *Encyc.* 8: 766. (1808).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from France. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Paris: *Poiret* (P holo).

Illustrations (Books): N.N.Tsvelev, *Grasses of the Soviet Union* (1983) (563 (377), Pl.7 as *A. pratensis*), N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 287), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (783), S-L Chen et al, *Flora of China*, Illustrations, *Poaceae* (2007) (Fig. 512).

Derivation (Clifford & Bostock 2007): *L. arundo*, reed; *-acea*, like. Culm tall, thereby resembling a reed.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, 23–105 cm long, 2 -noded. Leaf-sheaths glabrous on surface or puberulous. Ligule an eciliate membrane, 1.5–5 mm long, truncate or obtuse. Leaf-blades 6–40 cm long, 3–10 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform, linear, 1.7–7 cm long, 0.6–1.4 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3.5–7 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.25 of their length connate, similar, reaching apex of florets or exceeding apex of florets, recurved at apex. Lower glume lanceolate, 3.5–7 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pilose, hairy on veins. Lower glume hairs 1–2 mm long. Lower glume apex acute. Upper glume lanceolate, 3.5–7 mm long, 1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pilose, hairy on veins. Upper glume hairs 1–2 mm long. Upper glume apex acute.

Florets. Fertile lemma ovate, 3.5–5.8 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below, with 0.33 of their length connate. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.4 way up back of lemma, straight or curved, 5–7.5 mm long overall, not or scarcely exerted from spikelet.

Flower and Fruit. Lodicules absent. Anthers 3, 3–3.6 mm long. Stigmas terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

TYPE from Iran. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mt. Elbrus: Aucher 5457 (G syn).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Pierre Martin Reni Aucher-Elroy (1792–1838) French botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Butt sheaths glabrous, persistent and investing base of culm, with reticulate dead sheaths. Culms erect, 20–60 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 2 mm long, obtuse. Leaf-blades 3–15 cm long, 2–5 mm wide. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform, elliptic or oblong, 1.3–2.5 cm long, 1–1.5 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 4.5–5 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.1 of their length connate, similar, exceeding apex of florets. Lower glume lanceolate, 4.5–5 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pilose. Lower glume apex acuminate, awned, 1 -awned, awn 1–2 mm long. Upper glume lanceolate, 4.5–5 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pilose. Upper glume apex acuminate, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma oblong, 3–4 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33 way up back of lemma, straight or geniculate, 6.5–10 mm long overall, clearly exerted from spikelet, without a column or with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 1.8–2.7 mm long. Stigmas terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Caucasus, Western Asia. Transcaucasus. Iran.

Alopecurus baptarrhenius S.M. Phillips. *Kew Bull.* 41(4): 1027 (1986).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ethiopia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Dinsho: *Gilbert 1818* (K holo).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (53, Fig. 25).

Derivation (Clifford & Bostock 2007): Gk. *baptos*, bright-colored; arrhen, male. The persistent anthers are initially yellow, then reddish-brown.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual or perennial, short-lived. Culms erect or geniculately ascending, 10–30 cm long. Leaf-sheaths loose. Ligule an eciliate membrane, 3–6 mm long, acute. Leaf-blades flat or conduplicate, 5–10 cm long, 1–3 mm wide. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear or oblong, 2.5–4.5 cm long. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–4.5 mm long, falling entire.

Glumes. Glumes connate along margins below, similar, reaching apex of florets. Lower glume oblong, 3–4.5 mm long, 1 length of upper glume, membranous, much thinner above, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pubescent. Lower glume hairs 0.5 mm long. Lower glume apex obtuse. Upper glume oblong, 3–4.5 mm long, 1 length of adjacent fertile lemma, membranous, much thinner above, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pubescent. Upper glume hairs 0.5 mm long. Upper glume apex obtuse.

Florets. Fertile lemma elliptic, 3–4.5 mm long, membranous, keeled, 4 -veined, more than 3-veined. Lemma margins connate below, with 0.33–0.5 of their length connate. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33–0.5 way up back of lemma, straight, 3 mm long overall, clearly exerted from spikelet (1–1.6mm). Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 1.3–2 mm long, orange. Stigmas protogynous, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Ethiopia (inc. Eritrea).

Alopecurus bonariensis Parodi & Thellung. *Fedde, Repert.* 23 :302 (1927).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Avellaneda: *Parodi 6526*.

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina 3 – 2 Pooideae* (2012) (128), A.Burkat, *Flora Ilustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (131, Fig. 43), A.L.Cabrera, *Flora de la Provincia de Buenos Aires, IV Pt 2 Gramineas* (1970) (214, Fig. 55), M.N.Correa, *Flora Patagonica Parte III, Gramineae* (1978) (343, Fig. 230), B.Rosengurt, *Gramineas Uruguayas I* (1970) (22, Fig. 3).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Provincia de Buenos Aires, Argentina.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms geniculately ascending, 5–30 cm long. Ligule an eciliate membrane, 2–3.5 mm long, obtuse. Leaf-blades 3–6 cm long, 2.5–3 mm wide. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath, exerted or embraced at base by subtending leaf. Peduncle cylindrical at apex. Panicle spiciform, oblong or ovate, 1–3 cm long, 0.4–0.5 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 2.6–2.8 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.33 of their length connate, similar, exceeding apex of florets. Lower glume ovate, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scabrous, ciliate (below / tip). Lower glume surface pubescent. Lower glume apex obtuse. Upper glume ovate, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scabrous, ciliate (below / tip). Upper glume surface pubescent. Upper glume apex obtuse.

Florets. Fertile lemma oblong, 2.5 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below, with 0.33 of their length connate. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 3–3.5 mm long overall, with twisted column.

Flower and Fruit. Lodicules absent. Anthers 3, 0.5–0.6 mm long. Stigmas protogynous, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp, 1.3–1.5 mm long. Hilum punctiform.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northeast, Argentina South. Buenos Aires, Distrito Federal, Entre Rios, La Pampa, Santa Fe. Chubut.

Alopecurus borii Tsvelev. *Novosti Sist. Vyssh. Rast.*, 8: 21 (1971).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Amu Darya: *Nadezhina* (LE holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Norman Loftus Bor (1893–1972) Irish-born Indian forest botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending or decumbent, 10–30 cm long. Ligule an eciliate membrane, 1.5–4 mm long. Leaf-blades 1.2–4 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 2–6 cm long, 0.2–0.45 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs, puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 2.7–3.2 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.25–0.33 of their length connate, similar, shorter than spikelet. Lower glume elliptic, 2.5–3 mm long, 1 length of upper glume, cartilaginous, 1-keeled, winged on

keel, 3 -veined. Lower glume primary vein ciliolate. Lower glume apex acute. Upper glume elliptic, 2.5–3 mm long, 0.9 length of adjacent fertile lemma, cartilaginous, 1-keeled, winged on keel, 3 -veined. Upper glume primary vein ciliolate. Upper glume hairs 0.2 mm long. Upper glume apex acute.

Florets. Fertile lemma ovate, 2.7–3.2 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below. Lemma apex truncate, muticous. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 0.5–0.8 mm long. Stigmas terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Middle Asia. Uzbekistan.

Alopecurus bornmuelleri Domin. *Fedde, Repert. Nov. Sp.* 1: 4. (1905).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Palestine. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Palestine: Coll?.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Joseph Friedrich Nicolaus Bornmiller (1862–1948) German botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Culms erect, 25–35 cm long. Ligule an eciliate membrane, 2 mm long. Leaf-blades 2–5 mm wide.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform, oblong, 2–4 cm long, 1 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 6–6.5 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.33 of their length connate, similar, exceeding apex of florets, parallel to lemmas. Lower glume oblong, 1 length of upper glume, membranous, 1-keeled, winged on keel, winged narrowly, 3 -veined. Lower glume primary vein scabrous, ciliate (below). Lower glume apex acute. Upper glume oblong, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, winged on keel, 3 -veined. Upper glume primary vein scabrous, ciliate (below). Upper glume apex acute.

Florets. Fertile lemma lanceolate, 5.5–6 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below, with 0.33 of their length connate. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0–0.1 way up back of lemma, geniculate, 8–12 mm long overall, with twisted column.

Flower and Fruit. Lodicules absent. Anthers 3. Stigmas protogynous, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Western Asia. Palestine, Israel & Jordan.

Alopecurus brachystachyus Bieb. *Fl. Taur. Cauc. Suppl.* 56. (1819).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Transbaical: Coll? (LE holo).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 510).

Derivation (Clifford & Bostock 2007): Gk. *brachys*, short; *stachys*, ear of corn. Inflorescence comprised of short branches or spikelets short.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, 30–80 cm long. Leaf-sheaths smooth. Ligule an eciliate membrane, 1.5–2 mm long, truncate or obtuse. Leaf-blades 4–8 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform, oblong, 2–3.5 cm long, 1 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 4–5 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.33 of their length connate, similar, reaching apex of florets, recurved at apex. Lower glume elliptic, 4–5 mm long, 1 length of upper glume, cartilaginous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pubescent. Lower glume hairs 0.2 mm long. Lower glume apex acute. Upper glume elliptic, 4–5 mm long, 1 length of adjacent fertile lemma, cartilaginous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pubescent. Upper glume apex acute.

Florets. Fertile lemma ovate, 4–5 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 10–12 mm long overall, clearly exerted from spikelet, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3. Stigmas terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Siberia, Russian Far East, **China, Mongolia.** Buryatiya, Chita, Irkutsk, Tuva. Amur, Primorye. Inner Mongolia, Manchuria, China North-Central, Qinghai. Mongolia. Hebei.

Alopecurus bulbosus Gouan. *Hort. Monsp.* 37 (1762).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from France. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Montpellier: *Gouan* (K holo).

Illustrations (Books): C.E.Hubbard, *Grasses* (1968) (3330), T. Cope & A. Gray, *Grasses of the British Isles* (117).

Derivation (Clifford & Bostock 2007): *L. bulbosus*, onion; *-osa*, abundance. Culm-bases swollen.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 15–50 cm long, swollen at the base, forming an ovoid corm. Ligule an eciliate membrane, 2–6 mm long. Leaf-blades flat or convolute, 1.5–12 cm long, 1–3.5 mm wide. Leaf-blade surface smooth.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 1.5–7 cm long, 0.3–0.5 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis or with lateral stumps on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3–4 mm long, falling entire.

Glumes. Glumes similar, exceeding apex of florets. Lower glume oblong, 3–4 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliolate. Lower glume surface pubescent, hairy below. Lower glume apex acute. Upper glume oblong, 3–4 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliolate. Upper glume surface pubescent, hairy below. Upper glume apex acute.

Florets. Fertile lemma oblong, 2.5–3.5 mm long, membranous, keeled, 4 -veined, more than 3-veined. Lemma margins connate below. Lemma apex truncate, pubescent, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1–0.2 way up back of lemma, geniculate, 5–7 mm long overall, clearly exerted from spikelet, with a straight or slightly twisted column. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 2 mm long. Stigmas protogynous, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp, 1.6 mm long. Hilum punctiform.

$2n = 14$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia.

Region. Northern Europe, Middle Europe, Southwestern Europe, Southeastern Europe.

Country /Province /State. : Great Britain. : Belgium, Germany, Netherlands. : Corsica, France, Sardinia, Spain. : Italy, Sicily, Yugoslavia. **Northern Africa.** Algeria, Morocco, Tunisia. **Western Asia.** Turkey.

Alopecurus carolinianus Spreng., non Walt.(1788). *Nachr.1 Bot. Gart. Halle*, 10 (1801).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Derivation (Clifford & Bostock 2007): L. *-icum*, belonging to. From Crete.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms geniculately ascending, 7–22 cm long, 2–3-noded, rooting from lower nodes. Culm-internodes distally glabrous. Lateral branches sparse. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 2–3 mm long, obtuse. Leaf-blades 1–7 cm long, 1–3.5 mm wide. Leaf-blade surface glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, subtended by an unspecialized leaf-sheath or an inflated leaf-sheath. Panicle spiciform, linear, 2–3.5 cm long, 0.4–0.5 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3–4 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.5–0.8 of their length connate, similar, exceeding apex of florets, recurved at apex. Lower glume lanceolate, 3–4 mm long, 1 length of upper glume, membranous, 1-keeled, winged on keel, 3-veined. Lower glume primary vein ciliate. Lower glume surface pilose, hairy above. Lower glume apex obtuse, mucronate. Upper glume lanceolate, 3–4 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, winged on keel, 3-veined. Upper glume primary vein ciliate. Upper glume surface pilose, hairy above. Upper glume apex obtuse, mucronate.

Florets. Fertile lemma oblong, 2.7–3.5 mm long, membranous, keeled, 5-veined, more than 3-veined. Lemma margins connate below, with 0.5–0.66 of their length connate. Lemma apex truncate, awned, 1-awned. Principal lemma awn dorsal, geniculate, 3–6 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 1.2–2.5 mm long. Stigmas terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Europe, Temperate Asia, South America.

Region. Southeastern Europe.

Country /Province /State. : Bulgaria, Greece, Crete, Yugoslavia. **Western Asia.** Turkey. **Southern South America.** Argentina Northeast, Argentina South.

Buenos Aires. Río Negro.

Alopecurus dasyanthus Trautv. *Act. Hort. Petrop.* 5: 486 (1877).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Kerigo: *Radde* (LE holotype).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *dasys*, hairy; *anthos*, flower. Glumes and lemmas densely hairy.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths scarious, persistent and investing base of culm, with compacted dead sheaths. Culms erect or geniculately ascending, 15–30 cm long. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane. Leaf-blades filiform, conduplicate or involute, 5–10 cm long, 2–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle spiciform or capitate, elliptic or globose, 1–1.7 cm long, 1–1.2 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3–4.5 mm long, falling entire.

Glumes. Glumes connate along margins below, similar, reaching apex of florets, recurved at apex. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 3-veined. Lower glume primary vein ciliate. Lower glume margins ciliate. Lower glume apex acuminate, awned, 1-awned, awn 1–1.5 mm long. Upper glume lanceolate, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3-veined. Upper glume primary vein ciliate. Upper glume margins ciliate. Upper glume apex acuminate, awned, 1-awned, awn 1–1.5 mm long.

Florets. Fertile lemma ovate, 3–4.5 mm long, membranous, keeled, 5-veined, more than 3-veined. Lemma surface pubescent. Lemma apex obtuse, awned, 1-awned. Principal lemma awn dorsal, arising

0.25 way up back of lemma, geniculate, 9 mm long overall, clearly exerted from spikelet, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3. Stigmas protogynous, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

$2n = 14$ (2 refs TROPICOS), or 28 (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Caucasus, Western Asia. North Caucasus, Transcaucasus. Iran.

Alopecurus davisii Bor. *Notes Roy. Bot. Gard. Edinb.* 25: 63 (1963).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Turkey. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Samos: *Davis 1688* (K holotype, E).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Peter Hadland Davis (1918-) Scots botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Butt sheaths villous. Culms erect, 7.5–38 cm long, 1-noded. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 0.5–2 mm long, acute. Leaf-blades convolute, 1–5 cm long, 1–3 mm wide. Leaf-blade surface glabrous. Leaf-blade margins ciliate. Leaf-blade apex obtuse, simple or apiculate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle capitate, ovate, 0.9–2 cm long, 0.7–1 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3.5–4.5 mm long, falling entire.

Glumes. Glumes connate along margins below, similar, reaching apex of florets. Lower glume lanceolate, 3.5–4.5 mm long, 1 length of upper glume, membranous, 1-keeled, 3-veined. Lower glume primary vein ciliate. Lower glume surface pilose. Lower glume apex acute, awned, 1-awned, awn 1–1.5 mm long. Upper glume lanceolate, 3.5–5.5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3-veined. Upper glume primary vein ciliate. Upper glume surface pilose. Upper glume apex acute, awned, 1-awned, awn 1–1.5 mm long.

Florets. Fertile lemma oblong, 3.5–4 mm long, membranous, keeled, 5-veined, more than 3-veined. Lemma margins connate below, with 0.33 of their length connate. Lemma apex truncate, awned, 1-awned. Principal lemma awn dorsal, geniculate, 7–10 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 2.5–3 mm long. Stigmas terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Western Asia. East Aegean Is.

Alopecurus gerardii (All.) Vill. *Fl. Delph.* 5; *Hist. Pl. Dauph.* 2: 66. t. 2. (1787).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from France. **Basionym or Replaced Name:** *Phleum gerardii* All., *Fl. Pedem.* 2: 232 (1785). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Villars s.n.*, France: au fond du Valgaudemar, a Orciires, sur le Mont-Genèvre, vivace (GRM).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of John Gerard (1545–1612) English botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect or geniculately ascending, 7–40 cm long, 2-noded. Culm-internodes smooth, distally glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1–2 mm long, truncate. Leaf-blades 1–7 cm long, 1–4.2 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform, ovate, 1–2 cm long, 0.7–1 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 4–6.3 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.1 of their length connate, similar, exceeding apex of florets, recurved at apex. Lower glume lanceolate, 4–6.3 mm long, 1 length of upper glume, membranous, 1-keeled, 3-veined. Lower glume primary vein ciliate. Lower glume surface pilose. Lower glume apex mucronate or awned, 1-awned, awn 0.5–1.5 mm long. Upper glume lanceolate, 4–6.3 mm long, 1.3–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 3-veined. Upper glume primary vein ciliate. Upper glume surface pilose. Upper glume mucronate or awned, 1-awned, awn 0.5–1.5 mm long.

Florets. Fertile lemma oblong, 3–4 mm long, membranous, keeled, 5-veined, more than 3-veined. Lemma surface with conspicuous apical hairs. Lemma margins free. Lemma apex truncate, awned, 1-awned. Principal lemma awn dorsal, arising 0.33–0.5 way up back of lemma, straight, 0.8–6 mm long overall, not or scarcely exerted from spikelet. Palea linear, 2.5–3.5 mm long, 1-veined, 1-keeled. Palea keels ciliate, adorned above, with 0.5 of their length adorned. Palea apex acuminate.

Flower and Fruit. Lodicules absent. Anthers 3, 2–2.5 mm long. Stigmas terminally exerted, pubescent.

$2n = 14$ (3 refs TROPICOS).

Distribution (TDWG). Continent. Europe, Temperate Asia.

Region. Southwestern Europe, Southeastern Europe.

Country /Province /State. : France, Spain. : Albania, Bulgaria, Greece, Italy, Yugoslavia. **Western Asia.** Turkey.

Alopecurus glacialis C. Koch. *Linnaea* 21: 382. (1848).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Turkey. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *C. Koch s.n.*, Aug 1843, Turkey: A8 Rize: auf dem Rcken des pontischen Gebirges, im Gaue Hemschin, auf Granitboden, 2652 m (B(destroyed); IT: G).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. frozen. Growing at high altitudes.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths glabrous. Culms erect, 35–70 cm long, 2-noded. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1–1.5 mm long, obtuse. Leaf-blades 2–15 cm long, 1–2.7 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform, oblong or ovate, 0.9–2.5 cm long, 0.6–0.9 cm wide. Primary panicle branches accrescent to a central axis, with

evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3.5–5.5 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.1 of their length connate, similar, exceeding apex of florets, recurved at apex. Lower glume lanceolate, 3.5–5.5 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pilose. Lower glume apex setaceously acuminate, mucronate. Upper glume lanceolate, 3.5–5.5 mm long, 1.1–1.3 length of adjacent fertile lemma, membranous, purple, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pilose. Upper glume apex setaceously acuminate, mucronate.

Florets. Fertile lemma oblong, 3–4 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below. Lemma apex erose, truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33–0.5 way up back of lemma, straight or geniculate, 3–4.4 mm long overall, not or scarcely exerted from spikelet, without a column or with twisted column. Palea present or absent or minute, linear, 2–2.6 mm long, 1 -veined, 1-keeled.

Flower and Fruit. Lodicules absent. Anthers 3, 2–3.5 mm long. Stigmas terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

$2n = 42$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Caucasus, Western Asia. Iran.

Alopecurus hebechloides Hack. Fedde, *Repert.* 10:166 (1911).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Chile. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Chile, Colina to Batuco: Reiche (W holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk *-oides*, resembling. Resembling *Heleochloa* in some respect.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms geniculately ascending, 3–8 cm long, 2–3 -noded. Culm-internodes distally glabrous. Lateral branches lacking. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface. Ligule an eciliate membrane, 2–3 mm long, obtuse or acute. Leaf-blades 4–10 cm long, 2–3 mm wide, flaccid. Leaf-blade surface scaberulous, glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, shorter than basal leaves, subtended by an inflated leaf-sheath, embraced at base by subtending leaf. Panicle spiciform, ovate, loose, 1–1.5 cm long, 0.6–0.8 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong, glabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, truncate, 3 mm long, 1.5 mm wide, falling entire.

Glumes. Glumes similar, shorter than spikelet or reaching apex of florets, recurved at apex. Lower glume oblong, 3 mm long, 1 length of upper glume, membranous, much thinner above, much thinner on margins, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume lateral veins distinct, convergent at apex. Lower glume surface hispidulous, hairy on veins. Lower glume apex obtuse. Upper glume oblong, 3 mm long, 0.9–1 length of adjacent fertile lemma, membranous, much thinner above, with hyaline margins, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume lateral veins convergent at apex. Upper glume surface hispidulous, hairy on veins. Upper glume apex obtuse.

Florets. Fertile lemma oblong, 3 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below, with 0.75–0.8 of their length connate. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5–0.6 way up back of lemma, straight, 1–1.5 mm long overall, not or scarcely exerted from spikelet. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 2, 1 mm long. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Chile Central, Chile South. Coquimbo, Santiago. Magellanes.

***Alopecurus himalaicus* Hook. f. *Fl. Brit. Ind.* 7: 238. (1896).**

Alopecurus japonicus Steud. *Syn. Pl. Gram.* 149. (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

TYPE from Japan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Japan., (HT: L).

Illustrations (Books): T.Koyama, *Grasses of Japan and its neighbouring regions* (1987) (200, Fig 70), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 514).

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to; Japan, a modified spelling Zhapan introduced into Europe by Marco Polo as a transliteration for the Chinese name for the large islands to the east of that country. From Japan.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose, clumped densely. Basal innovations intravaginal. Culms geniculately ascending, 20–60 cm long, 1–2 mm diam., 3–4 -noded. Culm-internodes 2–8 cm long. Leaves basal and cauline. Leaf-sheaths loose, 3–4 cm long. Ligule an eciliate membrane, 2–4 mm long, white, obtuse. Leaf-blades 3–15 cm long, 3–8 mm wide, glaucous, pruinose. Leaf-blade surface scabrous, rough adaxially, glabrous.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform, linear, 3–10 cm long, 0.5–1 cm wide. Primary panicle branches accrescent to a central axis. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong, 0.3–0.8 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 5–6 mm long, falling entire.

Glumes. Glumes free, similar, shorter than spikelet, shiny. Lower glume elliptic, 4.2–4.5 mm long, 1.1 length of upper glume, membranous, light green, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume apex acute. Upper glume elliptic, 4–4.3 mm long, 0.8 length of adjacent fertile lemma, membranous, light green, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume apex acute.

Florets. Fertile lemma ovate, 5–6 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins free or connate below. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 10–12 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 1 mm long, pallid or yellow. Stigmas protogynous, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp, 2–2.5 mm long. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China, Eastern Asia. China South Central, China North-Central, China Southeast. Japan Honshu, or Shikoku, or Kyushu. Japan, Korea.

Shaanxi. Anhui, Fujian, Guangdong, Henan, Jiangsu, Zhejiang. Guizhou, Hubei, Sichuan, Yunnan.

Alopecurus laguroides Balansa. *Bull. Soc. Bot. Fr.* 21: 11 (1874).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Turkey. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Balansa 1551*, 15 Aug 1866, Turkey: A8 Riza: region alpine Karadeniz audessus se Djimil (Cimil) vers 3000 m alt. (P; IT: E, G).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Resembling *Lagurus* in respect of the inflorescence.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short. Butt sheaths glabrous. Culms erect, 5–20 cm long, 1–2 -noded. Culm-internodes distally glabrous. Leaves mostly basal. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 0.3–1 mm long, erose, truncate. Leaf-blades flat or convolute, 1–8 cm long, 0.5–2.5 mm wide. Leaf-blade surface glabrous. Leaf-blade margins smooth or scaberulous. Leaf-blade apex obtuse to acuminate.

Inflorescence. Inflorescence a panicle, subtended by an unspecialized leaf-sheath or an inflated leaf-sheath. Panicle capitate, elliptic or ovate, 0.8–2 cm long, 0.8–1.4 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3.5–4 mm long, falling entire.

Glumes. Glumes free or connate along margins below, 0–0.1 of their length connate, similar, exceeding apex of florets. Lower glume linear, 3.5–4 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface villous. Lower glume apex acute, awned, 1 -awned, awn 0.8–2 mm long, awn ciliate. Upper glume linear, 3.5–4 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface villous. Upper glume apex acute, awned, 1 -awned, awn 0.8–2 mm long, awn ciliate.

Florets. Fertile lemma oblong, 2.4–3 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy above. Lemma margins connate below. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1–0.25 way up back of lemma, geniculate, 7–9 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 1–1.4 mm long, yellow or purple. Stigmas terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Western Asia. Turkey.

Alopecurus lanatus Sibth. & Sm. *Prod.* 1: 43. (1806).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Turkey. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Turkey, Olympi Bythyni: *Sibthorp* (OXF holo, BM).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. lana*, wool; *-ata*, possessing. Leaf-blades densely pubescent.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Butt sheaths pubescent. Culms erect, 3.5–30 cm long, 1-noded. Culm-internodes distally pubescent. Leaves mostly basal. Leaf-sheaths pubescent. Ligule an eciliate membrane, 1.5–2.5 mm long, acute. Leaf-blades convolute, 1.5–5 cm long, 2–3 mm wide. Leaf-blade surface pubescent, densely hairy, hairy on both sides. Leaf-blade apex obtuse, simple or apiculate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle capitate, ovate or globose, 0.8–1.5 cm long, 0.8–1.5 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3.5–5 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.1 of their length connate, similar, exceeding apex of florets. Lower glume lanceolate, 3.5–5 mm long, 1 length of upper glume, membranous, 1-keeled, 3-veined. Lower glume primary vein ciliate. Lower glume surface hispid. Lower glume apex acute, awned, 1-awned, awn 1–1.5 mm long. Upper glume lanceolate, 3.5–5 mm long, 1.3–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 3-veined. Upper glume primary vein ciliate. Upper glume surface hispid. Upper glume apex acute, awned, 1-awned, awn 1–1.5 mm long.

Florets. Fertile lemma oblong, 2.4–3.5 mm long, membranous, keeled, 5-veined, more than 3-veined. Lemma surface pilose, hairy above. Lemma margins connate below, with 0.1 of their length connate. Lemma apex truncate, awned, 1-awned. Principal lemma awn dorsal, arising 0.15–0.2 way up back of lemma, geniculate, 6.5–11 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 1.8–2.7 mm long. Stigmas terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

n = 7 (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia.

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From the Straits of Magellan.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, 20–100 cm long, 3–6 -noded. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 4–6 mm long. Leaf-blades 10–35 cm long, 5–10 mm wide. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Peduncle tipped by a glumaceous appendage. Panicle spiciform, oblong or ovate, 1.5–5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 4.5–6 mm long, falling entire.

Glumes. Glumes similar, exceeding apex of florets. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pubescent. Lower glume hairs 1–2 mm long. Lower glume apex acute. Upper glume lanceolate, 1.3 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pubescent. Upper glume hairs 1–2 mm long. Upper glume apex acute.

Florets. Fertile lemma ovate, 3.5–4.5 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below, with 0.5 of their length connate, ciliolate, hairy above. Lemma apex obtuse,

awned, 1 -awned. Principal lemma awn dorsal, arising 0.25–0.33 way up back of lemma, geniculate, 4.5–9 mm long overall, with twisted column.

Flower and Fruit. Lodicules absent. Anthers 3, 2.5–3 mm long. Stigmas protogynous, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Europe, Temperate Asia, South America, Antarctica.

Region. Northern Europe, Eastern Europe.

Country /Province /State. : GB Aliens (Ryves et al). East European Russia, North European Russia, South European Russia. Siberia, Russian Far East, **Middle Asia.** Buryatiya, Chita, Irkutsk, Krasnoyarsk, Tuva. Kamchatka, Magadan. Kazakhstan. **Western Canada, Eastern Canada, Northwest USA, Southwestern USA.** British Columbia, Manitoba, Saskatchewan. Labrador, Ontario. Colorado, Idaho, Montana, Wyoming. Utah. **Western South America, Southern South America.** Bolivia. Argentina South, Chile Central, Chile South. **Subantarctic islands.** Falkland Is (Malvinas).

Mendoza. Chubut, Neuquén, Río Negro, Santa Cruz, Tierra del Fuego. Rest of Chile- Biobio, La Araucania, Maule, O'Higgins, Santado, Valpariso, Chiloe, Aisen, Magellanes. Maule, Biobio, La Araucania. Los Lagos, Aisen, Magellanes.

Alopecurus mucronatus Hack. ex Paulsen. *Kjoeb. Vidensk. Meddel.* 1903, 162. (1903).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Russia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Russia, Pamir: Paulsen 772 (C holotype, LE).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. mucro*, sharp point; -ata, possessing. With glumes or lemmas contracted into a short hard point or bifid and shortly awned from between the teeth.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Butt sheaths glabrous. Culms erect, 7–14 cm long. Leaves mostly basal. Ligule an eciliate membrane. Leaf-blades flat or conduplicate, 6–10 cm long, 4 mm wide, stiff. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle spiciform or capitate, oblong or ovate, 1.5–2 cm long, 1 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong or ovate, laterally compressed, 4 mm long, falling entire.

Glumes. Glumes similar, exceeding apex of florets, recurved at apex. Lower glume oblong, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pilose. Lower glume apex acuminate, mucronate. Upper glume oblong, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pilose. Upper glume apex acuminate, mucronate.

Florets. Fertile lemma ovate, 4 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33 way up back of lemma, 4 mm long overall. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3. Stigmas protogynous, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Middle Asia, Western Asia. Turkmenistan. Iran.

Alopecurus myosuroides Huds. *Fl. Angl.* 23 (1762).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Britain. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: In arvis et ad vias, *Hudson s.n.*.

Derivation (Clifford & Bostock 2007): Gk. *mys*, mouse; *ourus*, tail; *-oides*, resemblance. Inflorescence resembling the tail of a mouse.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms geniculately ascending or decumbent, 20–80 cm long. Ligule an eciliate membrane, 2–5 mm long. Leaf-blades 3–16 cm long, 2–8 mm wide. Leaf-blade surface scaberulous, rough adaxially or on both sides.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, tapering above, 2–12 cm long, 0.3–0.6 cm wide. Primary panicle branches accrescent to a central axis, with lateral stumps on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 4.5–7 mm long, falling entire.

Glumes. Glumes connate along margins below, similar, reaching apex of florets. Lower glume lanceolate or oblong, 4.5–7 mm long, 1 length of upper glume, membranous, 1-keeled, winged on keel, winged narrowly, winged above, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pubescent, hairy below. Lower glume apex acute. Upper glume lanceolate or oblong, 4.5–7 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, winged on keel, winged above, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pubescent, hairy below. Upper glume apex acute.

Florets. Fertile lemma ovate, 4.5–7 mm long, membranous, keeled, 4 -veined, more than 3-veined. Lemma margins connate below. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1–0.2 way up back of lemma, geniculate, 8–14 mm long overall, clearly exerted from spikelet, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 3–4 mm long. Stigmas protogynous, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

$n = 7$ (1 ref TROPICOS), or 14 (3 refs TROPICOS). $2n = 14$ (8 refs TROPICOS).

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia, Tropical Asia, Australasia (*), North America, South America.

Region. Northern Europe, Middle Europe, Southwestern Europe, Southeastern Europe, Eastern Europe.

Alopecurus nepalensis Trin. ex Steud. *Syn. Pl. Gram.* 148. (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from Nepal. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Nepal: Wallich 3780.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Nepal.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, (5–)15–45 cm long. Leaf-sheaths inflated (slightly). Ligule an eciliate membrane, 2–3 mm long, obtuse. Leaf-blades 4–9 cm long, 2.5–3 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, tapering above, 1–5 cm long, 0.3–0.5 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3–3.5 mm long, falling entire.

Glumes. Glumes connate along margins below, similar, reaching apex of florets. Lower glume oblong, 3–3.5 mm long, 1 length of upper glume, membranous, 1-keeled, winged on keel, 3 -veined. Lower glume primary vein ciliolate. Lower glume surface glabrous. Lower glume apex obtuse or acute. Upper glume oblong, 3–3.5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, winged on keel, 3 -veined. Upper glume primary vein ciliolate. Upper glume surface glabrous. Upper glume apex obtuse or acute.

Florets. Fertile lemma elliptic, 3–3.5 mm long, membranous, keeled, 4 -veined, more than 3-veined. Lemma margins connate below. Lemma apex obtuse or acute, mucous (or with a basal stump). Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 0.6 mm long. Stigmas protogynous, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

n = 7 (2 refs TROPICOS).

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (785), E.Hafliger & E.Schultz, *Grass Weeds*, CIBA-GEIGY (2:14(1980)).

Derivation (Clifford & Bostock 2007): in honor of Alfred Barton Rendle (1865–1938) English botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Rhizomes short. Culms erect or geniculately ascending, 8–40 cm long, 3–4 -noded. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1–3 mm long, obtuse. Leaf-blades 0.7–16 cm long, 1–3 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform, oblong or ovate, tapering above, 1.1–3.2 cm long, 0.9–1.1 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 5–8 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.33–0.5 of their length connate, similar, reaching apex of florets. Lower glume lanceolate, gibbous, 5–8 mm long, 1 length of upper glume, coriaceous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume apex cuspidate. Upper glume lanceolate, gibbous, 5–8 mm long, 1 length of adjacent fertile lemma, coriaceous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume apex cuspidate.

Florets. Fertile lemma oblong, 5–8 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below, with 0.5 of their length connate. Lemma apex obtuse or acute, awned, 1 -awned. Principal lemma awn dorsal, geniculate, 7–18 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 3.4–4.9 mm long. Stigmas terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Alopecurus saccatus Vasey. *Coult. Bot. Gaz.* 6: 290 (1881).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *T.J. Howell* 5, Jun 1881, USA: Oregon (US-75442; IT: US-746408 (fragm.)).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (787).

Derivation (Clifford & Bostock 2007): *L. saccus*, sac; -*atus*, possessing. Upper leaf-sheaths inflated.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 10–25 cm long. Culm-internodes distally glabrous. Ligule an eciliate membrane, 2 mm long. Leaf-blades 5–12 cm long, 1–5 mm wide.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath, exerted or embraced at base by subtending leaf. Panicle spiciform, linear or oblong, loose, 2–4 cm long. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, linear.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 4–5 mm long, falling entire.

Glumes. Glumes similar, exceeding apex of florets. Lower glume oblong, 4–5 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface puberulous, hairy on veins. Lower glume apex obtuse. Upper glume oblong, 4–5 mm long, 1.5–1.7 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface puberulous, hairy on veins. Upper glume apex obtuse.

Florets. Fertile lemma ovate, 2.7–3 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2–0.25 way up back of lemma, geniculate, 8–12 mm long overall. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 1 mm long. Stigmas protogynous, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA, Southwestern USA, Mexico. Oregon, Washington. California. Northwest Mexico. Baja California.

Alopecurus setarioides Gren. *Mem. Soc. Emul. Doubs*, Ser. 3, 2: 459 (1857).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from France. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: France, Marseille: Coll?.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Inflorescence spicate resembling that of *Setaria*.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, culms solitary or caespitose. Culms erect or geniculately ascending, 12–35 cm long, 2–3 -noded. Lateral branches lacking or sparse. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1–2.5 mm long, erose, obtuse or acute. Leaf-blades 1.2–10 cm long, 0.8–3.5 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform, oblong or ovate, 0.8–3.2 cm long, 0.6–1.1 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.2–4.5 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.33 of their length connate, similar, exceeding apex of florets. Lower glume lanceolate, 3.2–4.5 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume apex acute. Upper glume lanceolate, 3.2–4.5 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume apex acute.

Florets. Fertile lemma oblong, 3–3.6 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below, with 0.33 of their length connate. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, geniculate, 6.5–10.5 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 1.5–2 mm long. Stigmas terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Europe, Temperate Asia.

Region. Northern Europe (*), Southeastern Europe.

Country /Province /State. : GB Aliens (Ryves et al). : Greece, Turkey Europe, Yugoslavia. **Caucasus, Western Asia.** Turkey.

Alopecurus textilis Boiss. *Diagn. Ser.* 1, 13: 40. (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Iran. **Basionym or Replaced Name:** *Alopecurus tiflisiensis* (Westb.) Grossheim & Schischk. *Sched. Herb. Pl. Or. Exsicc.* 15 (1924). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Iran, Besmitschal: *Kotschy 351* (G hol., E, K).

Illustrations (Books): N.L.Bor, *Gramineae* in K.H.Rechinger, *Flora Iranica*. No. 70/30 (1970) (Tab. 43), N.L.Bor, *Gramineae* in *Flora of Iraq* (1968) (291, Pl. 103).

Derivation (Clifford & Bostock 2007): *L. textilis*, intertwined. Used for weaving or thatching.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Butt sheaths pubescent, persistent and investing base of culm, with compacted dead sheaths. Culms erect or geniculately ascending, 5–70 cm long. Leaves mostly basal. Leaf-sheaths pubescent. Ligule an eciliate membrane, 0.5–1 mm long, truncate. Leaf-blades filiform or linear, flat or convolute, 15–30 cm long, 1–3 mm wide. Leaf-blade surface smooth. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform, elliptic, 1–3 cm long, 0.6–1.5 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 4.5–6 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.25 of their length connate, similar, exceeding apex of florets. Lower glume lanceolate, 4.5–6 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pilose. Lower glume apex acute, mucronate or awned, 1 -awned, awn 1–2 mm long. Upper glume lanceolate, 4.5–6 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pilose. Upper glume apex acute, mucronate or awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma oblong, 4–5.5 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy above. Lemma margins connate below. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33 way up back of lemma, geniculate, 8–14(–17) mm long overall, with twisted column. Palea 2.5–4 mm long, 1 -veined, 1-keeled.

Flower and Fruit. Lodicules absent. Anthers 3, 3.5–4 mm long. Stigmas terminally exserted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Middle Asia, Caucasus, Western Asia. Tadjhikistan. Iran, Iraq.

Alopecurus turczaninovii O.D. Nikiforova. *Bot. Zhurn.*, 73(11): 1601 (1988).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Russia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Russia, Baical, Possolskoi: Turczaninov.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Porphir Kiril nicolas Stepanovich Turczaninov (1796–1864) Russian botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Rhizomes short. Culms erect or geniculately ascending, 15–30 cm long, 2–3 -noded. Ligule an eciliate membrane. Leaf-blades 1–4 mm wide.

Inflorescence. Inflorescence a panicle. Panicle spiciform, oblong, 2–3 cm long, 1–1.5 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 4–4.5 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.1 of their length connate, similar, exceeding apex of florets. Lower glume lanceolate, 4–4.5 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pilose, hairy on veins. Lower glume apex truncate. Upper glume lanceolate, 4–4.5 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pilose, hairy on veins. Upper glume apex truncate.

Florets. Fertile lemma oblong, 3.5–4 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins connate below. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, 9–10 mm long overall.

Distribution (TDWG). Continent. Temperate Asia.
Country /Province /State. Siberia. Irkutsk.

Alopecurus utriculatus Banks & Sol. *Russ. Nat. Hist. Aleppo (ed. 2) 2: 243 (1794).*

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006) (& as *A. anthoxanthoides*), T.G.Tutin et al, *Flora Europaea* 5 (1980), W.D.Clayton & N.Snow, *Key to Pacific Grasses* (2010).

TYPE from Syria. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Russell s.n.*, Syria: Aleppo (BM).

Illustrations (Books): G.Hegi, *Flora von Mitteleuropa* 1 (1909), N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 289), N.L.Bor, *Gramineae in Flora of Iraq* (1968) (293, Pl. 104).

Derivation (Clifford & Bostock 2007): *L. utriculus*, little belly; *-ata*, possessing. Upper leaf-sheath inflated.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, culms solitary or caespitose. Culms geniculately ascending, 4–40 cm long, 3–4 -noded. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 2–4 mm long, arose, truncate. Leaf-blades 0.7–12 cm long, 0.8–8 mm wide. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform, oblong or ovate, 0.8–4 cm long, 0.6–1.5 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 5–8.5 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.33–0.5 of their length connate, similar, reaching apex of florets. Lower glume lanceolate, 5–8.5 mm long, 1 length of upper glume, membranous, 1-keeled, winged on keel, winged above, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pilose, hairy below. Lower glume apex acute. Upper glume lanceolate, 5–8.5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, winged on keel, winged above, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pilose, hairy below. Upper glume apex acute.

Florets. Fertile lemma oblong, 5–8.5 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below, with 0.5 of their length connate. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 6–15 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 3, 3.2–4.2 mm long. Stigmas terminally exserted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Illustrations (Books): N.L.Bor, *Gramineae in Flora of Iraq* (1968) (295, Pl. 105).

Derivation (Clifford & Bostock 2007): *L. vagina*, sheath; *-ata*, possessing. Leaf-sheaths conspicuous.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, culms solitary or caespitose. Rhizomes elongated. Butt sheaths glabrous, persistent and investing base of culm, with compacted dead sheaths. Culms erect, 18–30 cm long. Leaves mostly basal. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 0.5–2 mm long, truncate. Leaf-blades filiform, flat or convolute, 1–15 cm long, 1–2 mm wide. Leaf-blade surface scaberulous, rough adaxially, glabrous. Leaf-blade margins scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, subtended by an inflated leaf-sheath. Panicle spiciform or glomerate, oblong or ovate or globose, 1.4–2.5 cm long, 0.7–1.3 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis with rounded ribs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 3–4.5 mm long, falling entire.

Glumes. Glumes connate along margins below, 0.1 of their length connate, similar, reaching apex of florets. Lower glume elliptic, 3–4.5 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein ciliate. Lower glume surface pilose. Lower glume apex acute, mucronate or awned, 1 -awned, awn 0.6–1.8 mm long. Upper glume elliptic, 3–4.5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein ciliate. Upper glume surface pilose. Upper glume apex acute, mucronate or awned, 1 -awned, awn 0.6–1.8 mm long.

Florets. Fertile lemma oblong, 3–4.5 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma margins connate below. Lemma apex truncate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.33 way up back of lemma, geniculate, 5–10.5 mm long overall, clearly exerted from spikelet, with twisted column. Palea 1 -veined, 1-keeled.

Flower and Fruit. Lodicules absent. Anthers 3, 2.3–3.3 mm long. Stigmas terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Europe, Temperate Asia.

Region. Eastern Europe.

Country /Province /State. Krym. Caucasus, Western Asia. Iran, Iraq.

Altoparadisium chapadense Filg. et al. *Ann. Missouri Bot. Gard.*, 88(2): 363 (2001).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil, Alto Paraiso: *Filgueiras & Fonseca* 2987 (IBGE holo, ICN, K, MO, SI, SP, US). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: IT: *Filgueiras & Fonseca* 2987, 5 Sep 1994, Brazil (MO).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (138, Fig.47 as *Panicum*).

Illustrations (Journals): *Ann. Missouri Bot. Gard.* (88: 355, Fig.1 (2001)).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Serra da Chapada, Brazil.

Classification. Subfamily Panicoideae. Tribe: Paniceae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped moderately. Rhizomes short, knotty, scaly. Culms 75–80 cm long, 6–9 -noded. Culm-internodes thin-walled, distally glabrous. Culm-nodes flush with internodes, purple, glabrous. Lateral branches lacking or sparse, arising from mid culm. Leaves cauline. Leaf-sheaths without keel, striately veined, glabrous on surface, outer margin glabrous or hairy. Ligule a fringe of hairs, 0.3–0.5 mm long. Leaf-blades linear or lanceolate, 6–10 cm long, 3–8 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade margins scabrous. Leaf-blade apex attenuate, muticous or pungent.

Inflorescence. Inflorescence a panicle, exerted or embraced at base by subtending leaf. Peduncle 2–4.5 cm long. Panicle contracted, lanceolate or oblong, 6.5–14.5 cm long, 1.5–3.5 cm wide. Primary panicle branches 2–8 -nate, whorled at most nodes. Panicle axis glabrous. Panicle branches glabrous, bearded in axils (1–3mm). Spikelets solitary or in pairs. Fertile spikelets pedicelled. Pedicels present, filiform, unequal, 1–3 mm long, ciliate, hairy at tip and at base, with 1–4 mm long hairs, tip discoid.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate or oblong, dorsally compressed, 3–3.2 mm long, falling entire. Spikelet callus pilose. Spikelet callus hairs 1–1.5 mm long.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, firmer than fertile lemma. Upper glume oblong, 1 length of spikelet, membranous, without keels, 3–5 -veined. Upper glume surface hispid, hairy on veins. Upper glume awned, 1 -awned, awn 18–26 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, oblong, 1 length of spikelet, membranous, much thinner on margins, 3 -veined, with conspicuous midvein, ribbed, pubescent, acute. Fertile lemma absent. Palea absent or minute.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1.8–2.1 mm long, purple. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, lanceolate or oblong, dorsally compressed, 1.8–1.9 mm long, light brown. Embryo 0.33 length of caryopsis. Hilum elliptic, 0.2 length of caryopsis.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central.
Goiás.

Altoparadisium scabrum (Pilg. & Kuhlm.) T.S. Filgueiras, G. Davidse, F.O. Zuloaga & O. Mor.
Ann. Missouri Bot. Gard. 88(2): 366 (2001).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Arthropogon scaber* Pilg. & Kuhlm., *Comm. Lin. Teleg.*, *Bot.* 67(11): 37–38, t. 2 (1922)

. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *F.C. Hoehne 2015(48)*, Jun 1901, Brazil: Matto Grosso: Caceres, Agua Quente (R).

Illustrations (Journals): *Ann. Missouri Bot. Gard.* (88: 367, Fig.7 (2001) as var. *scabrum*).

Derivation (Clifford & Bostock 2007): L. rough or gritty to the touch. Plants with rough leaf-blades, spikelets or stems.

Classification. Subfamily Panicoideae. Tribe: Paspaleae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths thickened and forming a bulb. Culms 30–70 cm long. Culm-nodes glabrous. Ligule an eciliate membrane, 1 mm long. Leaf-blades linear or lanceolate, flat or conduplicate, 15–30 cm long, 10 mm wide. Leaf-blade surface glabrous or pilose. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, 15–18 cm long. Spikelets solitary or in pairs. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 6 mm long, 1 mm wide, falling entire. Spikelet callus pubescent. Spikelet callus hairs 0.15 length of spikelet.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume subulate, 10–12 mm long. Upper glume oblong, 1 length of spikelet, coriaceous, without keels, 3 -veined. Upper glume surface scabrous. Upper glume awned, 1 -awned, awn 13–15 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, oblong, 1 length of spikelet, coriaceous, 3 -veined, scabrous, obtuse. Fertile lemma linear, membranous, without keel. Lemma apex obtuse. Palea absent or minute.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil. Bolivia. Brazil West Central.
Mato Grosso, Goiás.

Images: Plant Image Collection Smithsonian Institution;

Derivation (Clifford & Bostock 2007): *L. auris*, ear; *-ula*, diminutive; *-ata*, possessing. Leaf-blades rounded at the base or with auricles.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 2000–2500 cm long, 5–10 mm diam., woody. Culm-internodes terete, solid, 40–83 cm long, distally pubescent. Lateral branches dendroid. Bud complement 1. Branch complement many, in a clump, subtended by a bare patch above the node, with 1 branch dominant. Culm-sheaths present, deciduous but leaving a persistent girdle, glabrous or pubescent, auriculate, setose on shoulders. Culm-sheath ligule 0.5 mm high, ciliate. Culm-sheath blade lanceolate or ovate, erect, 7.5–19.2 cm long, pubescent. Leaves cauline, 16 per branch. Leaf-sheath oral hairs setose. Leaf-sheath auricles falcate. Ligule a ciliolate membrane, 0.2–0.5 mm long, scarious. Collar with external ligule. Leaf-blade base asymmetrical, with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, oblong, 16–21 cm long, 15–30 mm wide. Leaf-blade apex acuminate.

Inflorescence. Synflorescence bractiferous, fasciculate, 10–20 cm long, with glumaceous subtending bracts, without axillary buds at base of spikelet, prophyllate below lateral spikelets.

Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 3–30 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 9–29 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes definite, clavate.

Glumes. Glumes one the lower absent or obscure, persistent, shorter than spikelet, similar to fertile lemma in texture. Upper glume lanceolate, 5–7 mm long, 0.6–0.8 length of adjacent fertile lemma, chartaceous, without keels, 5 -veined. Upper glume surface hispidulous. Upper glume margins ciliate. Upper glume apex obtuse.

Florets. Fertile lemma lanceolate, 8–9 mm long, chartaceous, without keel, 5–6 -veined, more than 3-veined. Lemma surface puberulous. Lemma margins ciliolate. Lemma apex acuminate. Palea 1 length of lemma, chartaceous. Palea surface pubescent, hairy on back. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 2 mm long, veined, ciliate. Anthers 2, 5 mm long. Stigmas 2. Ovary glabrous. Caryopsis with fleshy pericarp, obovoid, 2 mm long. Endosperm farinose.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast.

Bahia.

Alvimia gracilis T.R. Soderstrom & X. Londono. *Amer. J. Bot.*, 75(6): 835 (1988).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: *Olivencia: Calderon, dos Santos & Oliveira 2446* (CEPEC holo).

Illustrations: None found.

Images: Plant Image Collection Smithsonian Institution; E.J.Judziewicz, E.J., *American Bamboos* (1999);

Derivation (Clifford & Bostock 2007): *L. slender*. Culms or inflorescences slender.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 600–800 cm long, 3–5 mm diam., woody. Culm-internodes terete, solid, 20–47 cm long, distally pubescent. Lateral branches dendroid, intravaginal. Bud complement 1. Branch complement many, in a clump, subtended by a bare patch above the node, with 1 branch dominant. Culm-sheaths present, deciduous but leaving a persistent girdle, pubescent, without auricles. Culm-sheath ligule 0.5 mm high, brown, ciliate. Culm-sheath blade lanceolate or ovate, erect, 2.7 cm long, pubescent. Leaves cauline, 3–8 per branch. Leaf-sheath oral hairs scanty, 1 mm long. Ligule a ciliolate membrane, 0.5

mm long, scarious. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.3 cm long, petiole glabrous. Leaf-blades deciduous at the ligule, linear or ovate, 4–8 cm long, 6–16 mm wide. Leaf-blade surface papillose, rough adaxially, glabrous. Leaf-blade margins ciliate. Leaf-blade apex acuminate, hairy.

Inflorescence. Synflorescence bractiferous, fasciculate, with glumaceous subtending bracts, with axillary buds at base of spikelet, prophyllate below lateral spikelets.

Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 10–27 fertile florets, with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 160–270 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes definite, clavate.

Glumes. Glumes several, 1–3 empty glumes, persistent, shorter than spikelet, similar to fertile lemma in texture. Upper glume lanceolate, 6 mm long, chartaceous, without keels.

Florets. Fertile lemma lanceolate or ovate, 5–6.5 mm long, chartaceous, without keel, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma surface glabrous, inner surface pubescent. Lemma margins ciliate. Lemma apex acuminate. Palea 1 length of lemma, chartaceous, 1 -veined, without keels. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 1.3 mm long, membranous, ciliate. Anthers 2, 3.3 mm long. Stigmas 2. Ovary glabrous. Caryopsis with fleshy pericarp, obovoid, 16 mm long. Endosperm farinose.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*).

TYPE from Argentina. **Basionym or Replaced Name:** *Stipa ambigua* Speg., *Revista Argent. Bot.* 1(1): 27 (1925). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Spegazzini s.n.*, 24 Nov 1905, Argentina: Prov. Buenos Aires, Pdo. Gral. Pinto: "in pratis circa Estación Iriarte" (LP ex LPS-2412; IT: BAA-2946, US-2947420).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina 3 – 2 Pooideae* (2012) (375), A.L.Cabrera, *Flora de la Provincia de Buenos Aires, IV Pt 2 Gramineas* (1970) (262, Fig. 67 as *Stipa*).

Derivation (Clifford & Bostock 2007): L. uncertain. Species that may be readily confused with others.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–100 cm long. Culm-internodes distally glabrous. Lateral branches lacking. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 0.2 mm long. Leaf-blades filiform, convolute, 20–45 cm long, 0.6 mm wide. Leaf-blade surface glabrous. Leaf-blade margins ciliate. Leaf-blade apex attenuate, pungent.

Inflorescence. Inflorescence a panicle, exserted or embraced at base by subtending leaf. Panicle open, 20–45 cm long, bearing few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 0.5–1 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–10 mm long, 1 length of upper glume, hyaline, yellow or purple, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 6–10 mm long, 1.5–2 length of adjacent fertile lemma, hyaline, yellow or purple, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 4–5.5 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, with conspicuous apical hairs. Lemma margins convolute, covering most of palea. Lemma hairs 2–4 mm long. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 25–30 mm long overall, with 14–24 mm long limb, with twisted column, deciduous. Column of lemma awn 3–7 mm long, glabrous. Palea 3–4 mm long, chartaceous, 2 -veined, without keels. Palea surface pilose (1–2mm), hairy on back.

Flower and Fruit. Lodicules 3. Anthers 3, 1.5–2.5 mm long, anther tip penicillate. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform, 2.5–3.5 mm long, dark brown. Hilum linear, 0.66–0.75 length of caryopsis.

Cleistogenes present, in lower sheaths.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northeast, Argentina South, Argentina Northwest, Uruguay.

San Luis, Buenos Aires, Cordoba, Entre Rios, La Pampa, Chubut, Neuquén, Río Negro, Santa Cruz.

Derivation (Clifford & Bostock 2007): Gk. *brachys*, short; *chaete*, bristle. Awn of lemma shorter than that of related species.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 40–90 cm long. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 0.2–0.5 mm long, pilose on abaxial surface, truncate. Leaf-blades filiform, flat or convolute, 8–35 cm long, 0.5–3 mm wide, stiff. Leaf-blade surface scaberulous, rough adaxially or on both sides, glabrous. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle, exerted or embraced at base by subtending leaf. Panicle open, equilateral, 10–25 cm long, bearing few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.4–0.5 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–8 mm long, 1 length of upper glume, hyaline, without keels, 1–3 -veined. Lower glume lateral veins absent or obscure. Lower glume apex setaceously acuminate. Upper glume lanceolate, 6–8 mm long, 1.5–2 length of adjacent fertile lemma, hyaline, without keels, 1–3 -veined. Upper glume lateral veins absent or obscure. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 4–5.5 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy on back. Lemma margins convolute, covering most of palea. Lemma apex attenuate, awned, 1 -awned. Principal lemma awn geniculate or bigeniculate, 10–18 mm long overall, with 6–12 mm long limb, with a straight or slightly twisted column. Column of lemma awn 2–4 mm long, glabrous. Palea 3–3.5 mm long, 2 -veined, without keels. Palea surface pilose, hairy on back (extending beyond tip).

Flower and Fruit. Lodicules 3. Anthers 3, 2–2.4 mm long, anther tip penicillate. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, oblong, 2–3 mm long (x0.9–1mm). Hilum linear, 1 length of caryopsis.

Cleistogenes present, in upper sheaths and in lower sheaths.

Distribution (TDWG). Continent. Australasia, South America.

Country /Province /State. **Australia** (*). New South Wales. **Southern South America.** Argentina Northeast, Argentina South, Argentina Northwest, Chile Central, Uruguay.

Catamarca, Mendoza, Salta, Santiago del Estero, San Luis. Buenos Aires, Cordoba, Distrito Federal, Entre Rios, La Pampa, Santa Fe. Río Negro.

Amelichloa brevipes (E. Desv.) Arriaga & Barkworth. *Sida* 22 (1):147 (2006).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*).

TYPE from Chile. **Basionym or Replaced Name:** *Stipa brevipes* E. Desv., *Fl. Chil.* 6: 282 (1854). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *C. Gay 1106*, no date, Chile: en las provincias centrales de le República (P; IT: BAA (fragm.), US-866138 (fragm.)).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (376).

Derivation (Clifford & Bostock 2007): *L. brevis*, short; *pes*, foot. Pedicels short.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Stolons present. Culms 50–100 cm long, 1–2 mm diam., 4–5 -noded. Culm-nodes swollen, pallid or brown or purple, glabrous. Leaf-sheaths smooth, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a ciliolate membrane, 0.4–1 mm long. Leaf-

blades filiform, conduplicate, 15–30 cm long, 0.4–1 mm wide, stiff or firm. Leaf-blade surface ribbed. Leaf-blade apex mucous or pungent.

Inflorescence. Inflorescence a panicle, comprising 15–30 fertile spikelets. Panicle open, linear. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–10 mm long, ciliate.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 11–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, 1 mm long, pilose, acute. Floret callus hairs 2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, much thinner on margins, without keels, 5 -veined. Lower glume apex acuminate. Upper glume lanceolate, 11–15 mm long, membranous, with hyaline margins, without keels, 5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 7–9.8 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma hairs 1–1.3 mm long. Lemma apex dentate, 2 -fid, with lobes 1 mm long, awned, 1 -awned. Principal lemma awn from a sinus, bigenulate, 23–35 mm long overall, with twisted column. Middle segment of lemma awn 5–9 mm long. Column of lemma awn 4–10 mm long, pubescent, with 0.7–0.8 mm long hairs. Palea 5–7 mm long, without keels. Palea surface pilose. Palea apex ciliate.

Flower and Fruit. Lodicules 3. Anthers 3, yellow, anther tip penicillate. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform, 6–7 mm long. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina South, Chile Central, Chile South. Mendoza. Chubut, Neuquén, Río Negro, Santa Cruz. Santiago. Aisen, Magellanes.

Derivation (Clifford & Bostock 2007): *L. cauda*, tail; *ata*, possessing.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 55–100 cm long. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 0.3–0.5 mm long, pilose on abaxial surface, truncate. Leaf-blades straight or curved, filiform or linear, flat or involute or convolute, 25–70 cm long, 2–7 mm wide, firm. Leaf-blade surface scaberulous, rough adaxially, glabrous. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle, exerted or embraced at base by subtending leaf. Panicle open, equilateral, 14–45 cm long, bearing many spikelets or few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5–1 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–11 mm long, 1 length of upper glume, hyaline, without keels, 3 -veined. Lower glume surface scabrous, rough on veins, glabrous or pilose, hairy on veins. Lower glume margins eciliate or ciliate. Lower glume apex setaceously acuminate. Upper glume lanceolate, 5–11 mm long, 1.5–2 length of adjacent fertile lemma, hyaline, without keels, 3 -veined. Upper glume surface scabrous, rough on veins, glabrous or pilose, hairy on veins. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 4–6 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy between veins. Lemma margins convolute, covering most of palea. Lemma apex attenuate, surmounted by a ring of hairs, with this appendage 0.7–1 mm long, awned, 1 -awned. Principal lemma awn flexuous or bigeniculate, 12–25 mm long overall, with 6–15 mm long limb, with a straight or slightly twisted column. Column of lemma awn 2–4 mm long, glabrous. Palea 2 -veined, without keels. Palea surface pubescent, hairy on back (not exceeding tip).

Flower and Fruit. Lodicules 3. Anthers 3, 3–4 mm long, anther tip penicillate. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, obovoid, 3 mm long (x1–1.4mm). Hilum linear, 1 length of caryopsis.

Cleistogenes present, in lower sheaths.

Distribution (TDWG). Continent. Europe, Australasia, North America, South America.

Amelichloa clandestina (Hack.) Arriaga & Barkworth. *Sida* 22 (1):148 (2006).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*).

TYPE from Mexico. **Basionym or Replaced Name:** *Stipa clandestina* Hack., *Repert. Spec. Nov. Regni Veg.* 8: 516 (1910). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Arsène 3441*, Mar 1908, Mexico: Coahuila: Saltillo (W; ILT: MO-845904, US-1030718, US-3168628 (fragm. ex W)). LT designated by Hitchcock, *Contr. U.S. Natl. Herb.* 24(7): 238 (1925). Although this number is attributed to Michoacán by Hackel in the protologue, the labels on the MO and US specimens indicate that the collection was made in Coahuila. A transcription error seems probable.-- *fide* G. Davidse, 1998.

ST: *E. Palmer* 3, Apr 1898, Mexico: Coahuila: prope Saltillo (MO, US).

Recent Synonyms: *Achnatherum clandestinum* (Hack.) M.E. Barkworth, *Phytologia*, 74(1): 6 (1993).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (183).

Derivation (Clifford & Bostock 2007): L. hidden. The inflorescence is enclosed or partially enclosed in the upper leaf-sheath.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Culms erect, 50–80 cm long, 1–2 -noded. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 1 mm long, pilose on abaxial surface. Leaf-blades flat or conduplicate or involute, 10–20 cm long, 1–2 mm wide, light green. Leaf-blade apex hardened.

Inflorescence. Inflorescence a panicle, terminal or terminal and axillary, embraced at base by subtending leaf or enclosed. Axillary inflorescences different from terminal (cleistogamous), enclosed.

Panicle open, lanceolate, 10–20 cm long. Primary panicle branches appressed or ascending. Panicle branches bearded in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent (white), acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, chartaceous, without keels, 3 -veined. Lower glume surface asperulous. Lower glume apex acuminate. Upper glume lanceolate, 8 mm long, chartaceous, without keels, 3 -veined. Upper glume surface asperulous. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 6 mm long, coriaceous, pallid, without keel, 5 -veined, more than 3-veined. Lemma surface pilose, hairy below. Lemma margins convolute, covering most of palea. Lemma hairs white. Lemma apex surmounted by a ring of hairs, with this appendage 1 mm long, awned, 1 -awned. Principal lemma awn bigenulate, 11–18 mm long overall, with twisted column. Middle segment of lemma awn 3–5 mm long. Column of lemma awn 3–5 mm long. Palea 2 -veined, without keels.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Africa, North America (*).

Country /Province /State. Southern Africa. Gauteng, Northern Cape, Western Cape, Eastern Cape. **South-central USA, Mexico.** Texas. Central Mexico, Northwest Mexico.

Mexico State, Puebla. Aguascalientes, Coahuila, Neuvo Leon, San Luis Potosi, Zacatecas. Michoacan.

Ammocalamagrostis baltica (Flggi ex Schrad.) P. Fourn. *Monde Pl.* 35: 28 (1934).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980) (as *xAmmocalamagrostis*).

TYPE from Germany. **Basionym or Replaced Name:** *Arundo baltica* Fluegg. ex Schrad., *Fl. Germ.* 223. I. 5. f. 4 (1806). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Germany: litoribus maris baltici prope Svienemunde, *Fleugge*.

Illustrations (Books): C.E.Hubbard, *Grasses* (1968) (286).

Derivation (Clifford & Bostock 2007): From one of the countries bordering the Baltic sea.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms erect or geniculately ascending, robust, 70–150 cm long. Leaf-sheaths without keel, smooth. Ligule an eciliate membrane, 10–25 mm long, acute. Leaf-blades flat or involute, 50–100 cm long, 3–7 mm wide, stiff. Leaf-blade surface ribbed (above), scaberulous (above), glabrous or puberulous (above). Leaf-blade apex attenuate, pungent.

Inflorescence. Inflorescence a panicle. Peduncle distinct, smooth or scaberulous above. Panicle spiciform, lanceolate, tapering above, 13–25 cm long, 1.7–3 cm wide. Primary panicle branches 3–7 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–4 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 9–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded. Floret callus hairs 5–7 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets. Lower glume lanceolate, 9–12 mm long, chartaceous, 1-keeled, 1–3 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acute. Upper glume lanceolate, 9–12 mm long, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 7–9 mm long, cartilaginous, keeled, 3–7 -veined, more than 3-veined. Lemma surface asperulous. Lemma apex dentate, 2 -fid, awned. Principal lemma awn subapical, straight, 1–2 mm long overall. Palea 2–4 -veined. Palea keels scaberulous.

Flower and Fruit. Anthers 3, 4–4.5 mm long, indehiscent.

Distribution (TDWG). Continent. Europe.

Region. Northern Europe, Middle Europe, Southwestern Europe, Eastern Europe.

Country /Province /State. : Denmark, GB Aliens (Ryves et al), Norway, Sweden. : Germany, Netherlands, Poland. : France. Baltic States.

Ammochloa involucrata Murb. *Act. Univ. Lund.* 6 Afd. II. no. 1. 11. (1900).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Morocco. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Larache: *Mellerio* (P holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. involucrum*, cover; *-ata*, possessing. Inflorescence subtended by bracts.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 2–15 cm long. Leaf-sheaths inflated, reticulately veined. Ligule an eciliate membrane or absent, 0–0.3 mm long. Leaf-blades 3–8 cm long, 1–2 mm wide. Leaf-blade margins cartilaginous, scaberulous.

Inflorescence. Inflorescence a panicle, comprising 6–15 fertile spikelets, shorter than basal leaves, deciduous as a whole, subtended by a spatheole, embraced at base by subtending leaf. Spatheole lanceolate, herbaceous (reticulately veined). Peduncle disarticulating, disarticulating below uppermost sheaths. Panicle capitate, globose, 0.8–1 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1–3 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets, or of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 6–8 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes similar, shorter than spikelet. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, winged on keel, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute, mucronate. Upper glume lanceolate, 0.5–0.9 length of adjacent fertile lemma, membranous, 1-keeled, winged on keel, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute, mucronate.

Florets. Fertile lemma elliptic, 5–7 mm long, membranous, without keel, 5(–7) -veined, more than 3-veined. Lemma apex entire or dentate, 2 -fid, obtuse, muticous or mucronate.

Flower and Fruit. Lodicules absent. Anthers 3, 2.7–4 mm long. Stigmas 2, terminally exerted, pubescent. Ovary glabrous. Caryopsis with adherent pericarp, ellipsoid, 1.8–2 mm long, apex rostrate (0.25–0.33 length of grain). Hilum punctiform.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northern Africa. Morocco.

Ammochloa palaestina Boiss. *Diagn. Ser.* 1, 13: 52 [May] (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006) (& as *A. unispiculata*, *A. subacaulis*), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Palestine. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Boissier s.n.*, Palestine (G).

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 339), L.Boulos, *Flora of Egypt* 4 (2005) (154, Fig. 43), N.L.Bor, *Gramineae in Flora of Iraq* (1968) (53, Pl. 15).

Images: L.Boulos, *Flora of Egypt* 4 (2005);

Derivation (Clifford & Bostock 2007): from Palestine.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms 0.5–4 cm long. Leaf-sheaths loose or inflated. Ligule an eciliate membrane, 1.5 mm long, lacerate. Leaf-blades 1.7–7(–9) cm long, 0.5–1.5 mm wide. Leaf-blade margins scaberulous.

Inflorescence. Inflorescence a panicle, shorter than basal leaves. Panicle capitate, ovate or globose. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 4–14 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the

upper sterile. Spikelets oblong, laterally compressed, 8–15 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 3–5 mm long, 1 length of upper glume, scarios, much thinner on margins, 1-keeled, winged on keel, winged narrowly, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume ovate, 3–5 mm long, 0.75–1 length of adjacent fertile lemma, scarios, with hyaline margins, 1-keeled, winged on keel, 1 -veined. Upper glume primary vein scaberulous. Upper glume apex acute.

Florets. Fertile florets recurved at tip. Fertile lemma ovate, 4–5 mm long, chartaceous or coriaceous, much thinner on margins, yellow, without keel, 5 -veined, more than 3-veined. Lemma surface smooth or scabrous, glabrous or pilose. Lemma apex acute, mucronate. Palea 1 length of lemma, 2 -veined. Palea keels scaberulous. Palea apex truncate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules absent. Anthers 3, 0.6–0.8 mm long. Ovary beaked. Caryopsis with adherent pericarp, ellipsoid, trigonous, 1.4 mm long, apex rostrate. Embryo 0.33 length of caryopsis. Hilum punctiform.

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia.

Region. Southwestern Europe.

Country /Province /State. : Spain. **Northern Africa.** Algeria, Egypt, Libya, Morocco, Tunisia. **Caucasus, Western Asia, Arabian Peninsula.** Iran, Iraq, Palestine, Israel & Jordan, Turkey. Kuwait, Saudi Arabia.

Ammochloa pungens (Schreb.) Boiss. Diagn. Ser. 1, 13: 52. (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Algeria. **Basionym or Replaced Name:** *Dactylis pungens* Schreb., *Beschreibung der Graser* 2: 42, t. 27, f. 1. (1772). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Algeria: Coll?.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. pungo*, prick. Leaf-blades sharp-pointed.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms geniculately ascending or decumbent, 1–25 cm long. Leaf-sheaths loose or inflated. Ligule an eciliate membrane, 1–3 mm long, entire or lacerate. Leaf-blades 1–5 cm long, 1–5 mm wide. Leaf-blade margins scaberulous. Leaf-blade apex obtuse, apiculate.

Inflorescence. Inflorescence a panicle, aerial. Panicle capitate, globose, 0.5–1.5 cm long. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets well-developed, 1–2 in number, barren, ovate, 4 mm long, smaller than fertile. Basal sterile spikelet glumes membranous.

Fertile Spikelets. Spikelets comprising 7–10 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 5–6 mm long, breaking up at maturity, disarticulating above glumes but not between florets.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 4 mm long, 1 length of upper glume, scarios, much thinner on margins, without keels, 5 -veined. Lower glume apex obtuse or acute. Upper glume ovate, 4 mm long, 0.9 length of adjacent fertile lemma, scarios, with hyaline margins, without keels, 5 -veined. Upper glume apex obtuse or acute.

Florets. Fertile lemma ovate, 4.5 mm long, chartaceous, much thinner on margins, without keel, 5–9 -veined, more than 3-veined. Lemma surface pubescent, with capitate hairs. Lemma apex emarginate, awned, 1 -awned. Principal lemma awn from a sinus, 0.5–1 mm long overall. Palea 0.9 length of lemma, 2 -veined. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules absent. Anthers 3, 2.5–4 mm long. Ovary beaked. Caryopsis with adherent pericarp, oblong, plano-convex, 1.3–1.4 mm long, apex rostrate. Embryo 0.4 length of caryopsis, projecting below grain. Hilum punctiform.

Distribution (TDWG). Continent. Europe (*), Africa.

Region. Northern Europe (*).

Country /Province /State. : GB Aliens (Ryves et al). **Northern Africa, Macaronesia.** Algeria, Libya, Morocco. Canary Is.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Champlain, New York State, USA.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms erect or geniculately ascending, 70–100 cm long. Ligule an eciliate membrane, 1–3 mm long, scarious. Leaf-blades convolute, 20–60 cm long, 2–6 mm wide. Leaf-blade surface ribbed, scaberulous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, tapering above and tapering below, 13–16 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 10–11.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded.

Glumes. Glumes persistent, similar, exceeding apex of florets. Lower glume lanceolate, 9–10.5 mm long, 0.9 length of upper glume, chartaceous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acute. Upper glume lanceolate, 10–11.5 mm long, 1.1 length of adjacent fertile lemma, chartaceous, 1-keeled, 3 -veined. Upper glume surface asperulous. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 9–10.5 mm long, chartaceous, keeled, 5 -veined, more than 3-veined. Lemma surface scaberulous. Lemma apex acute. Palea 1 length of lemma, 2–4 -veined. Palea keels approximate. Rhachilla extension 0.25–0.33 length of fertile floret, pilose, hairy throughout but longer above.

Flower and Fruit. Anthers 3. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. North America.

Country /Province /State. Northeast USA. Vermont.

Ampelocalamus actinotrichus (Merr. & Chun) S.L. Chen T.H. Wen & G.Y. Sheng. *Acta Phytotax. Sin.*, 19(3): 334 (1981).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Arundinaria actinotricha* Merrill & Chun, *Sunyatsenia*, 2: 206 (1935). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *F.C. How & N.K. Chun* 70138, 21 August 1933, China: Kwangtung (US-1611894, US-3168191, US-82816, US-2012148).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 130).

Derivation (Clifford & Bostock 2007): *Gk. aktinos*, ray; *thrix*, hair. With hairs radiating from the orifice of the leaf-sheath.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, 150 cm long, woody. Culm-internodes terete, thin-walled. Lateral branches dendroid. Culm-sheaths present. Leaf-sheath oral hairs setose, spreading, 10–15 mm long. Leaf-sheath auricles erect, 1 mm long, obtuse. Ligule an eciliate membrane or a ciliolate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 10–18 cm long, 10–25 mm wide, light green. Leaf-blade surface pilose, sparsely hairy, hairy on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, bearing few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 5–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 40–60 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 5–7 mm long, eventually visible between lemmas.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume lanceolate, 5 mm long, chartaceous, without keels. Lower glume apex acuminate. Upper glume lanceolate, 7 mm long, chartaceous, without keels. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 11 mm long, 2.5 mm wide, chartaceous, keeled, lightly keeled, 7 - veined, more than 3-veined. Lemma midvein scaberulous. Lemma apex acuminate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3, 6 mm long. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. Hainan.

Ampelocalamus anhispidis Wen. *J. Bamboo Res.* 4(2): 11 (1985).

Accepted by: U. Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Lanshan, 600m., S.C. Chen CX84686 (HT: ZJFI).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk *an-*, without; L. *hispidus*, rough. Culm leaf-sheaths glabrous at the base.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China North-Central. Shandong.

Ampelocalamus breviligulatus (T.P. Yi) Stapleton. *Novon* 15:599 (2005).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Drepanostachyum breviligulatum* T.P. Yi, *J. Bamboo Res.*, 12(4): 42 (1993). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Guizhou: Guiyang, Bamboo Garden of G.Z.F.I., May 1992, Y.C. Zhong et al. 9203 (HT: GZFI).

Illustrations: None found.

Images: R. Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007); (as *A. breviligulata*).

Derivation (Clifford & Bostock 2007): L. *brevis*, short; *ligula*, little tongue; *-atus*, possessing. Ligule short.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose, clumped densely. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, pendulous at the tip, 300–600 cm long, 5–20 mm diam., woody, 25–34 -noded. Culm-internodes terete, thick-walled, 18–20 cm long, striate, distally glabrous. Lateral branches dendroid. Bud complement 3. Branch complement several, in an irregular line, with subequal branches or 1 branch dominant or 2 branches dominant. Culm-sheaths present, tardily deciduous, 12–27 cm long, 5 times as long as wide, coriaceous, glabrous or hispid, with grey hairs or yellow hairs, without auricles, glabrous on shoulders. Culm-sheath ligule 1–2 mm high, ciliolate. Culm-sheath blade linear or lanceolate, reflexed, 0.8–9 cm long, 1–7 mm wide, glabrous on surface. Leaves 2–9 per branch. Leaf-sheaths 2.2–3.8 cm long, pilose, outer margin hairy. Leaf-sheath oral hairs setose, 2.5–6 mm long. Ligule a ciliolate membrane, 1 mm long, purple. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.1–0.2 cm long. Leaf-blades deciduous at the ligule, lanceolate, 4–10.5 cm long, 6.5–10 mm wide, fleshy. Leaf-blade venation with 4–8 secondary veins, with obscure cross veins. Leaf-blade surface pubescent, hairy abaxially. Leaf-blade margins scaberulous. Leaf-blade apex attenuate. Flowering specimens unknown.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, China North-Central.
Gansu. Guizhou, Sichuan.

Ampelocalamus calcareus C.D.Chu & C.S.Chao. *Acta Phytotax. Sin.*, 21(2): 204 (1983).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Guizhou: Libo, Gaowang, 500 m, C.D. Chu et al. 81018 (HT: NFU; IT: GFI, GZAC).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *calx*, lime; *-arius*, pertaining to. Growing on limestone soils.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, inclined at the tip, 100–150 cm long, 4–5 mm diam., woody. Culm-internodes terete, 8–18 cm long, distally pubescent. Lateral branches dendroid. Bud complement 1. Branch complement several. Culm-sheaths present, persistent, pubescent, with white hairs, hairy on margins, auriculate, setose on shoulders, shoulders with straight hairs, shoulders with 10 mm long hairs. Culm-sheath ligule 7–10 mm high, ciliate. Culm-sheath blade lanceolate, reflexed. Leaves 2–3 per branch. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs setose, spreading and deciduous, 5–7 mm long. Leaf-sheath auricles falcate. Ligule a ciliolate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate or oblong, 7–20 cm long, 12–30 mm wide, indurate, mid-green and glaucous, discolorous with last colour beneath. Leaf-blade venation with 8–14 secondary veins. Leaf-blade surface glabrous. Leaf-blade apex acuminate. Flowering specimens unknown.

Distribution (TDWG). **Continent.** Temperate Asia.

Country /Province /State. China. China South Central.
Guizhou.

Ampelocalamus hirsutissimus (W. D. Li & Y. C. Zhong) Stapleton & Li. *Novon* 15:599 (2005).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Drepanostachyum hirsutissimum* W.D. Li & Yuan C. Zhong, *J. Bamboo Res.*, 16(1): 52 (1997). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Guizhou: Guiyang, Bamboo Garden of G.Z.F.I., May 1992, Y.C. Zhong et al. 9203 (HT: GZFI).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *hirsutus*, hairy; *-issima*, most. Plant in whole or in part very hairy.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, inclined at the tip, 300–500 cm long, 5–15 mm diam., woody. Culm-internodes terete, thick-walled, 12–18 cm long. Culm-nodes flush with internodes. Lateral branches dendroid. Bud complement 3. Branch complement several, in an irregular line. Culm-sheaths present, 22 cm long, 5–6 times as long as wide, coriaceous, hispid, with dark brown hairs, hairy on margins, without auricles, glabrous on shoulders. Culm-sheath ligule 1 mm high, ciliate. Culm-sheath blade linear, deciduous, erect, 1.5–2 cm long. Leaves 5–11 per branch. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs ciliate, erect, dark. Leaf-sheath auricles falcate. Ligule a ciliolate membrane, purple. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 11–17 cm long, 7–31 mm wide, fleshy. Leaf-blade venation with 6–8 secondary veins, with obscure cross veins. Leaf-blade surface pubescent. Leaf-blade margins scaberulous. Leaf-blade apex attenuate. Flowering specimens unknown.

Distribution (TDWG). **Continent.** Temperate Asia.

Country /Province /State. China. China South Central.
Guizhou.

Ampelocalamus luodianensis T.P. Yi & R.S. Wang. *J. Bamboo Res.*, 4(2): 3 (1985).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Guizhou: Chishui, steep slopes, 600–1000 m, *J.R. Xue et al. 7706* (HT: YNFC; IT: GFI).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 128).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Luodian Xian, Guizhou Province, China.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms scandent, 500–1000 cm long, 4–10 mm diam., woody. Culm-internodes terete, thin-walled, 8–20 cm long, distally mealy. Culm-nodes pubescent. Lateral branches dendroid. Bud complement 3. Branch complement several (4–11). Culm-sheaths present, deciduous, 12–17 cm long, 6–8 times as long as wide, green and purple, distinctly mottled with last colour, pilose. Culm-sheath ligule ciliolate. Culm-sheath blade lanceolate, erect, 3–7 cm long. Leaf-sheath oral hairs setose, spreading. Ligule a ciliolate membrane, 5 mm long. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 5–12 cm long, 7–17 mm wide. Leaf-blade venation with 6–8 secondary veins. Leaf-blade apex acuminate.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1–3 fertile spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 12–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 2–3 mm long.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume lanceolate, chartaceous, without keels, 3–5 -veined. Lower glume apex acuminate. Upper glume lanceolate, chartaceous, without keels, 5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 8–9 mm long, chartaceous, 7 -veined, more than 3-veined. Lemma apex acuminate. Palea apex dentate, 2 -fid. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 1. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central. Guizhou.

Ampelocalamus melicoideus (P.C.Keng) Li & Stapleton. *Novon* 15:599 (2005).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Drepanostachyum melicoideum* P.C. Keng, *J. Bamboo Res.*, 5(2): 35 (1986). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Sichuan: Nanchuan Xian, Da He Ba, 4 May 1957, *G.F. Li 60336* (HT: NJU; IT: SZ).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 131).

Derivation (Clifford & Bostock 2007): *Gk -oideum*, resembling. Similar to *Melica*.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 200–300 cm long, woody. Culm-internodes terete. Lateral branches suffrutescent. Ligule an eciliate membrane.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, subtended by bracts. Spatheole glumaceous, 1.5 cm long. Racemes 1, single, 3–4 cm long, bearing 3–4 fertile spikelets on each. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 12–15 mm long, 8–10 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes flattened, 1–1.5 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 5–7 mm long, herbaceous, without keels. Lower glume apex acuminate. Upper glume lanceolate, 5–7 mm long, herbaceous, without keels. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 9–11 mm long, herbaceous, without keel, 7–9 -veined, more than 3-veined. Lemma apex acute. Palea 10–12 mm long, 10 -veined. Palea apex truncate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 2 mm long, membranous. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central. Chongqing.

Ampelocalamus mianningensis (Q. Li & X. Jiang) D.Z. Li & Stapleton. *Kew Bull.* 51(4): 811 (1996).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Dendrocalamus mianningensis* Q. Li & Xin Jiang, *J. South-West. Forest. Coll.*, 1984(1): 134 (1984). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Sichuan: Mian'ning Xian, 1600–1700 m, 13 Aug. 1977, *Li 1128* (HT: Herb. Ya'an School, Ya'an City, SC; IT: SWFC).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 129).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Mianning Xian, Sichuan Province, China.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms 400–800 cm long, 15 mm diam., woody. Culm-internodes terete, thick-walled, 22.5–27 cm long. Lateral branches dendroid. Bud complement 1. Branch complement several, with 1 branch dominant. Culm-sheaths present, persistent, coriaceous, yellow and brown, distinctly mottled with last colour, hispid, hairy on margins, without auricles. Culm-sheath ligule 1 mm high, fimbriate. Culm-sheath blade lanceolate, erect or reflexed. Leaf-sheaths 7–8 cm long, glabrous on surface. Ligule a ciliolate membrane, 1–2 mm long. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 15–21 cm long, 30–35 mm wide. Flowering specimens unknown.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central. Sichuan, Yunnan.

Ampelocalamus microphyllus (Hsueh & Yi) C.J.Hsueh & T.P.Yi. *J. Bamboo Res.*, 4(2): 7 (1985).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Sinocalamus microphyllus* J.R. Xue & T.P. Yi, *J. Yunnan Forest. Coll.*, 1982(1): 71 (1982). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST?: *T.P. Yi 77181*, 15 Aug. 1977, China: Xizang: Medog (SFS).

ST?: *C.J. Wang 1285*, 4 June 1981, (YNFC).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 131).

Derivation (Clifford & Bostock 2007): GK, *micros*, small; *phyllon*, leaf. Leaf-blades short.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, 200–600 cm long, 5–15 mm diam., woody, 15–30 -noded. Culm-internodes terete, thin-walled, 5–35 cm long, light green, smooth, distally mealy or glabrous. Culm-nodes swollen. Lateral branches dendroid, ascending. Bud complement 1. Branch complement several, with 1 branch dominant. Culm-sheaths present, tardily deciduous, 9–14 cm long, 4–5 times as long as wide, chartaceous, puberulous, with grey hairs, without auricles. Culm-sheath ligule entire. Culm-sheath blade linear or lanceolate, reflexed, 0.8–6 cm long, 2–6 mm wide, glabrous on surface, acuminate. Leaves 4–10 per branch. Leaf-sheaths 2–4 cm long, glabrous on surface. Leaf-sheath oral hairs setose, spreading. Leaf-sheath

auricles absent. Ligule a ciliolate membrane, 1 mm long, lacerate, truncate. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.1–0.15 cm long. Leaf-blades deciduous at the ligule, lanceolate, 3–9 cm long, 4–11 mm wide, fleshy. Leaf-blade venation with 4 secondary veins, without cross veins. Leaf-blade surface glabrous. Leaf-blade margins scaberulous. Leaf-blade apex acuminate. Flowering specimens unknown.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central. Sichuan.

Ampelocalamus naibunensis (Hayata) P.C. Keng. *J. Bamboo Res.*, 5(2): 32 (1986).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Arundinaria naibunensis* Hayata, *Journ. Coll. Sc. Tokyo*, 30 Art. 1, 408 (1911). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Taiwan: Koshun: Naibun, ca. 1000 m, *G. Nakahara*.

Illustrations (Books): C-C Hsu, *Taiwan Grasses* (1975) (743, Pl. 1500 as *Chimonobambusa* & *Arthrostylidium*).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Naibun Taiwan.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms leaning, drooping at the tip, 300–600 cm long, 5–10 mm diam., woody. Culm-internodes terete, thick-walled, 12–18 cm long, smooth, distally glabrous. Culm-nodes swollen. Lateral branches fastigiate. Branch complement many, in a clump. Culm-sheaths present, deciduous, chartaceous, puberulous, truncate at apex, ciliate on shoulders. Culm-sheath blade linear, deciduous, glabrous on surface. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate, 3–6 mm long. Ligule a ciliolate membrane, obtuse. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.3–0.6 cm long. Leaf-blades deciduous at the ligule, linear or lanceolate, 6–14 cm long, 5–12 mm wide. Leaf-blade venation with 4–6 secondary veins. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1–3 fertile spikelets, terminal and axillary, subtended by bracts (and clustered at nodes). Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1–6 fertile florets, with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets, or of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 20–40 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume oblong, 3–5 mm long, chartaceous, without keels. Lower glume apex acute. Upper glume oblong, 3–5 mm long. Upper glume apex acute.

Florets. Fertile lemma ovate, 10–12 mm long, 3–4 mm wide, chartaceous, without keel, 7–11 -veined, more than 3-veined. Lemma apex acute. Palea 7–11 mm long, 11 -veined. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, ciliate. Anthers 3, 4 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Taiwan.

Ampelocalamus patellaris (Gamble) C.M.A. Stapleton. *Edinburgh J. Bot.* 51(3): 321 (1994).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from India. **Basionym or Replaced Name:** *Bambusa patellaris* Kurz ex Gamble, in syn, *Hook. f. Fl. Brit. Ind.* vii. 406 (1896). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Gamble 10045*, Nov 1881, India: Sikkim: Jungat, 1200 m (K). LT designated by Stapleton, *Edinburgh J. Bot.* 51: 321 (1994).

Recent Synonyms: *Chimonobambusa jainiana* Das.& Pal., *J. Econ. Tax. Bot.* 4:1023 (1983).

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (512, Fig. 7), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 129).

Derivation (Clifford & Bostock 2007): *L. patella*, smallish; *-aris*, pertaining to. Small dishes are made from the culm internodes.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 700–1000 cm long, 25–40 mm diam., woody. Culm-internodes terete, thin-walled, 30–45 cm long, dark green. Culm-nodes pubescent. Lateral branches dendroid. Culm-sheaths present, persistent, 25–30 cm long, 3–4 times as long as wide, hispid, with appressed hairs, with dark brown hairs, truncate at apex. Culm-sheath ligule fimbriate. Culm-sheath blade lanceolate, reflexed, 15 cm long. Leaf-sheaths keeled, striately veined, outer margin hairy. Ligule a ciliate membrane. Leaf-blade base asymmetrical, with a brief petiole-like connection to sheath, petiole 0.5 cm long. Leaf-blades lanceolate, 20–40 cm long, 25–100 mm wide. Leaf-blade midrib conspicuous. Leaf-blade venation with 16–20 secondary veins. Leaf-blade surface scaberulous, rough abaxially, glabrous. Leaf-blade margins scaberulous. Leaf-blade apex acuminate.

Inflorescence. Synflorescence bractiferous, clustered at the nodes, in globose clusters, 1–2.5 cm long, dense, with glumaceous subtending bracts, with axillary buds at base of spikelet, prophyllate below lateral spikelets, leafless between clusters.

Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 10 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes suppressed between florets.

Glumes. Glumes several, 1–2 empty glumes, persistent, similar, shorter than spikelet. Upper glume ovate, chartaceous, without keels. Upper glume apex acuminate.

Florets. Fertile lemma orbicular, 7 mm long, chartaceous, without keel, 9–11 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins ciliate. Lemma apex acute. Palea chartaceous, 4 -veined, 2-keeled but the uppermost without keels. Palea keels ciliate. Palea surface pubescent.

Flower and Fruit. Lodicules absent or 1 or 2, ciliate. Anthers 6, purple, anther tip with extended connective and pubescent. Filaments united in a tube. Stigmas 3, plumose. Ovary umbonate, pubescent on apex. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central. **Indian Subcontinent, Indo-China.** Assam, Eastern Himalaya, India, Nepal. Laos, Myanmar, Vietnam.

Yunnan. Darjeeling, Sikkim. Nagaland. West Bengal.

Ampelocalamus saxatilis (Hsueh & Yi) C.J.Hsueh & T.P.Yi. *J. Bamboo Res.*, 4(2): 7 (1985).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Sinocalamus saxatilis* J.R. Xue & T.P. Yi, *J. Yunnan Forest. Coll.*, 1982(1): 69 (1982). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Sichuan: Ebian, 2 Sept. 1974, *T.P. Yi 74227* (HT: SFS).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 132).

Derivation (Clifford & Bostock 2007): *L. saxum*, rock; *-atile*, place of growth. Dwelling among rocks.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, inclined at the tip or nodding at the tip, 300–600 cm long, 5–15 mm diam., woody, 22–30 -noded. Culm-internodes terete, thin-walled, 22–55 cm long, dark green, striate, antrorsely scabrous. Culm-nodes swollen, glabrous. Lateral branches dendroid. Bud complement 1. Branch complement several, with 1 branch dominant. Culm-sheaths present, tardily deciduous, 10–18 cm long, 3–4 times as long as wide, chartaceous, green or purple, concolorous or distinctly mottled with last colour, glabrous or puberulous, hairy on margins, truncate at apex, without auricles. Culm-sheath ligule 1 mm high, entire or ciliolate. Culm-sheath blade linear or lanceolate, narrower than sheath, reflexed, 0.4–4.5 cm long, 2–10 mm wide, glabrous on surface, acuminate. Leaves 4–10 per branch. Leaf-sheaths 3–8 cm long, glabrous on surface, outer margin hairy. Leaf-sheath oral hairs setose, spreading. Leaf-sheath auricles

falcate. Ligule a ciliolate membrane. Leaf-blade base cuneate, with a brief petiole-like connection to sheath, petiole 0.3–0.4 cm long. Leaf-blades deciduous at the ligule, lanceolate, 8–18 cm long, 10–22 mm wide, fleshy. Leaf-blade venation with 8–12 secondary veins, without cross veins. Leaf-blade margins scaberulous. Leaf-blade apex acuminate, pungent. Flowering specimens unknown.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central.
Sichuan, Yunnan.

Ampelocalamus scandens C.J.Hsueh & W.D.Li. *J. Bamboo Res.*, 4(2): 5 (1985).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 128).

Derivation (Clifford & Bostock 2007): *L. scando*, climb up, scrambling habit.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms scandent, pendulous at the tip, 600–1000 cm long, 4–8 mm diam., woody. Culm-internodes terete, solid, 15–30 cm long, distally pubescent. Culm-nodes swollen. Lateral branches dendroid. Bud complement 1. Branch complement several. Culm-sheaths present, persistent or tardily deciduous, 12–18 cm long, coriaceous, purple, pubescent, with white hairs, hairy on margins, without auricles. Culm-sheath ligule ciliate. Culm-sheath blade lanceolate, deciduous, reflexed. Leaves 3–4 per branch. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs setose, spreading. Leaf-sheath auricles falcate. Ligule a ciliolate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 3–10 cm long, 7–18 mm wide, fleshy. Leaf-blade apex acuminate. Flowering specimens unknown.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central.
Guizhou.

Ampelocalamus yongshanensis J.R. Xue & D.Z. Li. *J. Bamboo Res.*, 6(2): 10 (1987).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Yunnan: Yongshan, 600 m, 17 Apr 1985, *SWFC Bamboo Exped. J85063* (HT: SWFC).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Yongsang, Yunnan Province, China.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, drooping at the tip, 200–300 cm long, 5–10 mm diam., woody. Culm-internodes terete, thin-walled, 15–19 cm long, striate. Culm-nodes swollen. Lateral branches dendroid. Branch complement several or many. Culm-sheaths present, deciduous, chartaceous, pilose, with tawny hairs, without auricles. Culm-sheath ligule 1 mm high. Culm-sheath blade linear, reflexed, 0.5–3 cm long, pubescent. Leaves 2–10 per branch. Leaf-sheaths pilose. Leaf-sheath auricles absent. Ligule an eciliate membrane, 1 mm long, truncate. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, oblong, 9–17 cm long, 10–25 mm wide, fleshy. Leaf-blade venation with 6–12 secondary veins. Leaf-blade surface pilose, sparsely hairy. Flowering specimens unknown.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central.
Sichuan, Yunnan.

Ampelodesmos mauritanicus (Poir.) Th. Dur. et Schinz. *Consp. Fl. Afr.* 5 : 874 (1895).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960) (as *Deyeuxia arundinacea*), T.Koyama, *Grasses of Japan and its neighboring regions* (1987) (as *Festuca elatior*).

Basionym or Replaced Name: *Arundo mauritanica* Poir, *Voy. Barb.* 2: 104 (1789).

Recent Synonyms: *Deyeuxia arundinacea* P. Beauv., in syn, *Ess. Agrostogr.*: 160, t.15, f.11a-d (1812).

Illustrations (Books): T.Koyama, *Grasses of Japan and its neighbouring regions* (1987) (as *Festuca elatior*), C-C Hsu, *Flora of Taiwan*, Vol 5 (1978) (as *Deyeuxia arundinacea*), C-C Hsu, *Taiwan Grasses* (1975) (268 as *Deyeuxia arundinacea*), M.E.Barkworth et al, *Flora of North America north of Mexico Vol 24 Poaceae*, part 1 (2007) (113), M.E.Barkworth et al, *Flora of North America north of Mexico Vol 25 Poaceae*, part 2 (2003).

Images: R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);

Derivation (Clifford & Bostock 2007): L. -ica, belonging to. From Mauritania.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms 100–200 cm long. Culm-internodes solid. Ligule an eciliate membrane, 8–20 mm long, lacerate. Leaf-blades flat or convolute, 30–100 cm long, 4–7 mm wide, coriaceous, stiff. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 25–50 cm long. Primary panicle branches 5–10 cm long. Panicle branches scabrous, bearded in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 10–16 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes definite, villous, hairy above, with 2 mm long hairs. Floret callus bearded. Floret callus hairs 0.2 length of lemma.

Glumes. Glumes persistent, similar, reaching apex of florets or shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 6–9 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex attenuate. Upper glume lanceolate, 10–12 mm long, 0.8–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 5 -veined. Upper glume apex attenuate.

Florets. Fertile lemma lanceolate, 9–15 mm long, coriaceous, keeled, 5 -veined, more than 3-veined. Lemma midvein ciliate, hairy below. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, 1–2 mm long overall. Palea linear, 0.75 length of lemma, coriaceous, 2 -veined. Palea keels scaberulous. Palea apex dentate, 2 -fid. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, lanceolate, 2–3 mm long, membranous, ciliate, acute. Anthers 3, 5 mm long. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, linear, sulcate on hilar side, 5–6 mm long, hairy at apex. Embryo 0.25 length of caryopsis. Hilum linear, 1 length of caryopsis.

$2n = 48$ (FNA).

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia, North America (*).

Region. Southwestern Europe, Southeastern Europe.

Country /Province /State. : Baleares, Corsica, France, Portugal, Sardinia, Spain. : Greece, Italy, Sicily. **Northern Africa.** Algeria, Libya, Morocco, Tunisia. **Western Asia, Eastern Asia.** Iran. Japan Hokkaido, or Honshu, or Shikoku, or Kyushu. **Southwestern USA.** California.

Uttah Pradesh. Jammu Kashmir.

Amphibromus archeri (Hook.f.) P. F. Morris. *Vict. Nat.* 51: 146 (1934).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Helictotrichon*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Danthonia archeri* Hook. f. *Flora Tasmaniae* 2: 122, t. 163B. 1858. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Archer* 28, Australia: Tasmania: Cheshunt (K(central culm only); ILT: NSW). LT designated by Jacobs & Lapinpuro, *Telopea* 2: 726 (1986).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (196, Fig. 144), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (447, Fig. 87), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (135, Fig. 20), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): in honor of William Archer (1820–74), English-born Tasmanian botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms erect, 60–120 cm long, 1–3 mm diam., 2–4 -noded, not swollen at the base or swollen at the base, forming an ovoid corm. Culm-internodes terete, ridged, smooth or scaberulous. Culm-nodes glabrous. Leaf-sheaths ribbed, smooth. Ligule an eciliate membrane, 4.5–12.5 mm long, acute. Leaf-blades flat or involute, 15–32 cm long, 2.5–4 mm wide. Leaf-blade surface ribbed, grooved adaxially or abaxially, smooth or scaberulous, rough abaxially, pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, 15–35 cm long. Primary panicle branches 2–3 -nate, 7–15 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–7 fertile florets, with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 12–18 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 5.1–6.8 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume apex acute or acuminate. Upper glume elliptic, 6.4–9.2 mm long, 1.1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 5–7 -veined. Upper glume apex acute, muticous or mucronate.

Florets. Fertile lemma elliptic, 6–7.8 mm long, cartilaginous, without keel, 7 -veined, more than 3-veined. Lemma surface smooth or scabrous. Lemma apex dentate, 4 -fid, with lobes 2–3 mm long, awned, 5 -awned. Principal lemma awn dorsal, arising 0.55–0.6 way up back of lemma, geniculate, flat below, 14.5–17.5 mm long overall, with 9–12 mm long limb, with twisted column. Column of lemma awn 5–7.5 mm long, scabrous. Lateral lemma awns present, arising on apex of lobes, 0.5–0.8 mm long, shorter than principal. Palea 0.65–0.7 length of lemma. Palea keels ciliate. Palea surface smooth or papillose. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 1.4–1.9 mm long, membranous, glabrous, acute. Anthers 3, 2.3–2.4 mm long, eventually exerted or retained within floret. Ovary glabrous. Caryopsis with adherent pericarp, 1.7–2.2 mm long, light brown, glabrous. Embryo 0.2–0.3 length of caryopsis. Hilum linear, 0.3–0.35 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia (*). South Australia, Tasmania, Victoria. Southern.

Amphibromus fluitans T. Kirk. *Trans. N. Zeal. Inst.* 16: 374. t. 28. (1884).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Helictotrichon*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from New Zealand. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: T. Kirk s.n., New Zealand: Waihi Lake, Waikato (WELT-68389). LT designated by Edgar & Connor, *Fl. New Zealand* 5: 298 (2000).

Illustrations (Books): N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (447, Fig. 87), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (118), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (135, Fig. 20), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. fluito*, float. Leaves or rhizomes floating.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Stolons present. Culms decumbent, 40–75 cm long, 0.5–1.5 mm diam., 3–5 -noded. Culm-internodes terete, ridged, smooth or scaberulous. Culm-nodes glabrous. Leaf-sheaths ribbed, antrorsely scabrous. Ligule an eciliate membrane, 6.5–12 mm long, acute. Leaf-blades flat or involute, 10–25 cm long, 2–4.5 mm wide. Leaf-blade surface ribbed, grooved adaxially or abaxially, scabrous.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle contracted, 15–35 cm long. Primary panicle branches 2–3 -nate, 4–8.5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 10–20 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 6–10 fertile florets, with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 9–15 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 2.7–3.7 mm long, 0.8 length of upper glume, chartaceous, much thinner on margins, 1-keeled, 1–3 -veined. Lower glume lateral veins absent or distinct. Lower glume apex acute. Upper glume lanceolate, 3.5–4.5 mm long, 0.9 length of adjacent fertile lemma, chartaceous, with membranous margins, 1-keeled, 3–5 -veined. Upper glume apex acute.

Florets. Fertile lemma elliptic, 3.7–5 mm long, cartilaginous, without keel, 7 -veined, more than 3-veined. Lemma surface scabrous, glabrous or hispidulous. Lemma apex dentate, 2 -fid, with lobes 0.3–0.6 mm long, awned, 1 -awned. Principal lemma awn dorsal, arising 0.45–0.6 way up back of lemma, straight, flat below, 11–17 mm long overall, without a column. Palea 0.3–0.75 length of lemma. Palea keels ciliate. Palea surface smooth. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 0.9–1.23 mm long, membranous, glabrous, acute. Anthers 3, 1.5–1.7 mm long, eventually exerted or retained within floret. Ovary glabrous. Caryopsis with adherent pericarp, 1.3–1.7 mm long, light brown, glabrous. Embryo 0.1–0.2 length of caryopsis. Hilum linear, 0.25–0.3 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia, New Zealand. New South Wales, Victoria. New Zealand North I, New Zealand South I.

Western Slopes, Western Plains.

Amphibromus macrorhinus S.W.L. Jacobs & L. Lapinpuro. *Telopea* 2(6): 723 (1986).

Derivation (Clifford & Bostock 2007): Gk. *makros*, large; *rhis*, nose. Lemma apex drawn out.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths distinctly ribbed, glabrous. Culms erect, 50–100 cm long, 1–2.5 mm diam., 2–4 -noded. Culm-internodes terete or elliptical in section, ridged, smooth or scaberulous. Culm-nodes glabrous. Leaf-sheaths ribbed, smooth or scaberulous. Ligule an eciliate membrane, 6–17 mm long, acute. Leaf-blades flat or involute, 15–25 cm long, 1.5–4 mm wide. Leaf-blade surface ribbed, grooved adaxially or abaxially, smooth to scabrous, pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, 20–40 cm long. Primary panicle branches 1–3 -nate, 4–8 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 10–20 mm long.

Fertile Spikelets. Spikelets comprising 4–5 fertile florets, with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 10–17 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3.9–6.3 mm long, 0.9 length of upper glume, membranous, much thinner on margins, 1-keeled, 3–4 -veined. Lower glume apex acute or acuminate. Upper glume lanceolate, 4.2–7 mm long, 0.9–1.2

length of adjacent fertile lemma, membranous, with hyaline margins, 1-keeled, 5 -veined. Upper glume surface smooth or papillose. Upper glume apex acute.

Florets. Fertile lemma elliptic, 3.5–7.9 mm long, cartilaginous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface papillose, rough below. Lemma apex dentate, 4 -fid, with outer lobes shorter, with lobes 0.5–1.15 mm long, awned, 1 -awned. Principal lemma awn dorsal, arising 0.4–0.5 way up back of lemma, geniculate, 10–19 mm long overall, with 6.5–13.5 mm long limb, with a straight or slightly twisted column. Column of lemma awn 3.5–6.8 mm long, scabrous. Palea 0.66–0.95 length of lemma. Palea keels ciliate. Palea surface papillose. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 1–2.2 mm long, membranous, glabrous, acute. Anthers 3, 2.7–3 mm long, eventually exerted or retained within floret. Ovary glabrous. Caryopsis with adherent pericarp, 1.5–1.95 mm long, light brown, glabrous. Embryo 0.15–0.2 length of caryopsis. Hilum linear, 0.3–0.4 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Derivation (Clifford & Bostock 2007): in honor of Christian Gottfried Daniel Nees von Esenbeck (1766–1858) German botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent or elongated. Butt sheaths distinctly ribbed, glabrous. Culms erect, 80–150 cm long, 1–2.5 mm diam., 2–4 -noded. Culm-internodes terete or elliptical in section, ridged. Culm-nodes glabrous. Leaf-sheaths ribbed, smooth or scaberulous. Ligule an eciliate membrane, 6.5–8 mm long, acute. Leaf-blades flat or involute, 15–37 cm long, 2–4 mm wide. Leaf-blade surface ribbed, grooved adaxially or abaxially, smooth to scabrous, pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, 15–37 cm long. Primary panicle branches 1–3 -nate, 7–14 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 10–20 mm long.

Fertile Spikelets. Spikelets comprising 2–5 fertile florets, with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 8–14 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3.8–6.3 mm long, 0.6–0.8 length of upper glume, membranous, much thinner on margins, 1-keeled, 3–5 -veined. Lower glume apex acute. Upper glume lanceolate, 6.4–7.5 mm long, 1.1 length of adjacent fertile lemma, membranous, with hyaline margins, 1-keeled, 5–7 -veined. Upper glume apex acute.

Florets. Fertile lemma elliptic, 5.9–8.4 mm long, cartilaginous, without keel, 5–7 -veined, more than 3-veined. Lemma midvein ciliolate. Lemma surface scabrous or papillose. Lemma apex dentate, 2(–4) -fid, with outer lobes shorter, with lobes 0.26–0.36 mm long, awned, 1 -awned. Principal lemma awn dorsal,

arising 0.66–0.75 way up back of lemma, geniculate, 13.8–25.5 mm long overall, with 9–17.5 mm long limb, with twisted column. Column of lemma awn 4.8–6.5 mm long, scabrous, hirtellous. Palea 0.8–0.9 length of lemma. Palea keels ciliate. Palea surface papillose. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 1.3–2.3 mm long, membranous, glabrous, acute. Anthers 3, 1.3–2.3 mm long, eventually exerted or retained within floret. Ovary glabrous. Caryopsis with adherent pericarp, 2–3 mm long, light brown, glabrous. Embryo 0.1–0.2 length of caryopsis. Hilum linear, 0.35–0.45 length of caryopsis.

Distribution (TDWG). Continent. Europe (*), Australasia.

Region. Northern Europe (*).

Country /Province /State. : GB Aliens (Ryves et al). **Australia.** New South Wales, A.C.T., South Australia, Tasmania, Victoria.

Southern. Coast, Tablelands, Western Slopes, Western Plains.

Derivation (Clifford & Bostock 2007): *L. nervus*, nerve; *-osa*, abundance. With conspicuous nerves in the glumes or lemmas.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths distinctly ribbed, glabrous. Culms erect, 60–125 cm long, 1–3 mm diam., 2–5 -noded, without nodal roots or rooting from lower nodes. Culm-internodes terete or elliptical in section, ridged, smooth or scaberulous. Culm-nodes glabrous. Leaf-sheaths ribbed, smooth or scaberulous. Ligule an eciliate membrane, 10–20 mm long, acute. Leaf-blades flat or involute, 15–30 cm long, 1.5–3.5 mm wide. Leaf-blade surface ribbed, grooved adaxially or abaxially, scabrous, rough adaxially or on both sides.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle contracted, 20–40 cm long. Primary panicle branches 2–4 -nate, 7–14 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 10–20 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 4–6 fertile florets, with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 10–16 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3.4–5 mm long, 0.8–1 length of upper glume, membranous, 1-keeled, 1–3(–5) -veined. Lower glume lateral veins absent or distinct. Lower glume apex acute. Upper glume lanceolate, 4.5–6.2 mm long, 0.8–0.9 length of adjacent fertile lemma, membranous, 1-keeled, 3–5 -veined. Upper glume apex acute.

Florets. Fertile lemma elliptic, 5–7.2 mm long, cartilaginous, without keel, 5–7 -veined, more than 3-veined. Lemma surface scabrous. Lemma apex dentate, 2–4 -fid, with outer lobes shorter, with lobes 0.3–0.65 mm long, awned, 1 -awned. Principal lemma awn dorsal, arising 0.45–0.6 way up back of lemma, geniculate, 12–22 mm long overall, with 7–15 mm long limb, with twisted column. Column of lemma awn 4–8.5 mm long, scabrous. Palea 0.75–0.95 length of lemma. Palea keels ciliate. Palea surface smooth or papillose. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 0.95–1.3 mm long, membranous, glabrous, obtuse or acute. Anthers 3, 2.2–3 mm long, eventually exerted or retained within floret. Ovary glabrous. Caryopsis with adherent pericarp, 1.36–2.15 mm long, light brown, glabrous. Embryo 0.16–0.3 length of caryopsis. Hilum linear, 0.25–0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, A.C.T., South Australia, Victoria, Western Australia.

Ereman, South-West. Southern. Coast, Tablelands, Western Slopes, Western Plains.

Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): Gk *pithos*, large earthenware winw-jar; *gaster*, belly. At maturity the lemma is completely swollen.

Classification. Subfamily Pooideae. Tribe: Poaeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths distinctly ribbed, glabrous. Culms erect, 50–100 cm long, 1–2 mm diam., 2–3 -noded, not swollen at the base or swollen at the base, forming an ovoid corm. Culm-internodes terete or elliptical in section, ridged. Culm-nodes glabrous. Leaf-sheaths ribbed, smooth. Ligule an eciliate membrane, 2–5 mm long, acute. Leaf-blades flat or involute, 10–20 cm long, 1.5–5 mm wide. Leaf-blade surface ribbed, grooved adaxially, scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, 10–25 cm long. Primary panicle branches 2-nate, 4–8 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 10–30 mm long, ciliate.

Fertile Spikelets. Spikelets comprising 2–6 fertile florets, with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 8–15 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3.6–5.3 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume apex acute. Upper glume elliptic, 4.7–7.3 mm long, 0.8–1 length of adjacent fertile lemma, membranous, 1-keeled, 5–7 -veined. Upper glume apex acute.

Florets. Fertile lemma elliptic, 5.6–7.5 mm long, cartilaginous, without keel, 7 -veined, more than 3-veined. Lemma apex dentate, 4 -fid, with outer lobes shorter, with lobes 0.3–0.65 mm long, awned, 1 -awned. Principal lemma awn dorsal, arising 0.66–0.75 way up back of lemma, geniculate, flat below, 9–16 mm long overall, with 6–11 mm long limb, with twisted column. Column of lemma awn 3–5 mm long, scabrous. Palea 0.55–0.7 length of lemma. Palea keels ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 1.3–1.75 mm long, membranous, glabrous, acute. Anthers 3, 0.6–1.5 mm long, retained within floret. Ovary glabrous. Caryopsis with adherent pericarp, 1.6–2.1 mm long, light brown, glabrous. Embryo 0.25–0.3 length of caryopsis. Hilum linear, 0.4–0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Victoria.

Tablelands, Western Slopes.

Amphibromus quadridentulus (Doell) Swallen. *Am. Journ. Bot.* 18: 414 (1931).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Helictotrichon*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Avena quadridentula* Doell, *Mart. Fl. Bras.* 2 (3): 100 (1878). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: T: *A.F. Regnell 1410*, no date, Brazil: Minas Gerais (IT: S, US-75448 (fragm.)).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (134), L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (454 & 471, Fig. 97 & 101a), A.Burkat, *Flora Illustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (91, Fig. 28), B.Rosengurtt, *Gramineas Uruguayas I* (1970) (38, Fig. 10).

Derivation (Clifford & Bostock 2007): *L. quatuor*, four; *dens*, tooth; *-ulus*, diminutive. The lemma is bilobed and each lobe two-toothed.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths thickened and forming a bulb. Culms erect, 40–135 cm long. Leaf-sheaths longer than adjacent culm internode, smooth or scaberulous. Ligule an eciliate membrane, 4–12 mm long. Leaf-blades 8–30 cm long, 1–5 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, linear or oblong, 10–35 cm long. Primary panicle branches ascending or spreading, 3–7 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 5–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes glabrous.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume elliptic, 2–4 mm long, 0.66–0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume elliptic, 3–5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 3–5 mm long, cartilaginous, without keel, 7 -veined, more than 3-veined. Lemma surface scabrous. Lemma apex dentate, 2 -fid, with lateral lobes bidentate, awned, 1 -awned. Principal lemma awn dorsal, arising 0.75–0.85 way up back of lemma, geniculate, 2–6 mm long overall, with twisted column. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 3. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil South. Argentina Northeast, Uruguay.

Paraná, Rio Grande do Sul, Santa Catarina. Entre Rios, Misiones.

Derivation (Clifford & Bostock 2007): *L. reflexed*. Spikelets with spreading or reflexed awns.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths distinctly ribbed, glabrous or sparsely hairy. Culms erect, 80–150 cm long, 1–1.5 mm diam., 3–5 -noded. Culm-internodes terete or

elliptical in section, ridged, smooth or scaberulous. Culm-nodes glabrous. Leaf-sheaths ribbed, smooth or scaberulous. Ligule an eciliate membrane, 7–11 mm long, acute. Leaf-blades flat or involute, 15–30 cm long, 2–3 mm wide. Leaf-blade surface ribbed, grooved adaxially or abaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, 10–30 cm long. Primary panicle branches 2–3-nate, 3–6 cm long. Panicle axis scabrous. Panicle branches hispid. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 5–10 mm long, glabrous or pubescent.

Fertile Spikelets. Spikelets comprising 4–6 fertile florets, with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 7–11 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3.3–5.5 mm long, 0.8–1 length of upper glume, membranous, much thinner above, much thinner on margins, 1-keeled, 1–3 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent or distinct. Lower glume apex acute or acuminate. Upper glume elliptic, 4–5.4 mm long, 1 length of adjacent fertile lemma, membranous, much thinner above, with hyaline margins, 1-keeled, 3–5 -veined. Upper glume apex acute.

Florets. Fertile lemma elliptic, 4–5.2 mm long, cartilaginous, without keel, 5–7 -veined, more than 3-veined. Lemma surface hispid. Lemma apex dentate, 4 -fid, with simple equal lobes or with outer lobes shorter, with lobes 0.43–1 mm long, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5–0.66 way up back of lemma, geniculate, 9–18 mm long overall, with 5–13 mm long limb, with a straight or slightly twisted column. Column of lemma awn 3.3–3.5 mm long, hirtellous. Palea 0.7–0.95 length of lemma. Palea keels eciliate or ciliolate, adorned above. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 0.8–1.3 mm long, membranous, glabrous or ciliate, acute. Anthers 3, 1.2–2 mm long, eventually exerted. Ovary glabrous. Caryopsis with adherent pericarp, 1.8–2.3 mm long, light brown, glabrous. Embryo 0.1–0.3 length of caryopsis. Hilum linear, 0.2–0.35 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Illustrations (Journals): *Ruizia* (13:150, Fig 16c-d (1993)).

Derivation (Clifford & Bostock 2007): *L. scaber*, rough; *valva*, leaf of a folding door. The lemmas and/or glumes are densely hispid.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Butt sheaths thickened and forming a bulb. Culms erect, 40–100 cm long. Ligule an eciliate membrane, 6–12 mm long, lacerate. Leaf-blades 2–5 mm wide. Leaf-blade surface smooth or scabrous.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle open, lanceolate, 10–25 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 14–22 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 2 mm long, pilose. Floret callus pubescent, disarticulating obliquely.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3–5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1–3 -veined. Lower glume lateral veins absent or distinct. Lower glume apex acute. Upper glume lanceolate, 4–7 mm long, 0.5–1 length of adjacent fertile lemma, membranous, 1-keeled, 5–7 -veined. Upper glume apex acute.

Florets. Fertile lemma elliptic, 7 mm long, cartilaginous, without keel, 7–9 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 13–15 mm long overall, with twisted column. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 3, 2–2.7 mm long, eventually exerted or retained within floret. Ovary pubescent on apex. Caryopsis with adherent pericarp, ellipsoid, 2.5–3.5 mm long, hairy at apex. Hilum linear.

Cleistogenes absent or present, in upper sheaths or in lower sheaths.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil, Southern South America. Bolivia, Peru. Brazil South. Argentina Northeast, Argentina South, Chile Central, Chile South, Uruguay.

Rio Grande do Sul. Buenos Aires, Cordoba, Entre Rios, La Pampa, Santa Fe. Neuquén. Valparaiso, Maule, Biobio, La Araucania. Los Lagos.

Amphibromus sinuatus S.W.L. Jacobs & L. Lapinpuro. *Telopea*, 2(6): 727 (1986).

Derivation (Clifford & Bostock 2007): *L. sinus*, curve; -*ata*, possessing. Lemma apex sinuate.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Stolons present. Culms decumbent, 40–70 cm long, 0.8–2 mm diam., 1–4 -noded. Culm-internodes terete or elliptical in section, ridged, smooth. Culm-nodes glabrous. Leaf-sheaths ribbed, smooth or scaberulous. Ligule an eciliate membrane, 5–11 mm long, acute or acuminate. Leaf-blades 8–17 cm long, 1–4 mm wide. Leaf-blade surface ribbed, grooved adaxially or abaxially, scabrous.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle open, 10–21 cm long. Primary panicle branches 2–3 -nate, 5–11 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 10–20 mm long.

Fertile Spikelets. Spikelets comprising 5–6 fertile florets, with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 12–19 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3.7–4.5 mm long, 0.75–0.9 length of upper glume, membranous, 1-keeled, 1–3 -veined. Lower glume lateral veins absent or distinct. Lower glume apex acute or acuminate. Upper glume lanceolate, 4.3–5.8 mm long, 0.7 length of adjacent fertile lemma, membranous, 1-keeled, 3–5 -veined. Upper glume apex acute.

Florets. Fertile lemma elliptic, 6.2–8.2 mm long, cartilaginous, without keel, 7 -veined, more than 3-veined. Lemma surface scabrous. Lemma apex dentate, 4 -fid, with outer lobes shorter, with lobes 0.5–1 mm long, awned, 1 -awned. Principal lemma awn dorsal, arising 0.6–0.66 way up back of lemma, straight, flat below, 14–26 mm long overall, without a column. Palea 0.75–0.9 length of lemma. Palea keels ciliate. Palea surface smooth. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 1–1.6 mm long, membranous, glabrous, acute. Anthers 3, 2.2–3.3 mm long, eventually exerted or retained within floret. Ovary glabrous. Caryopsis with adherent pericarp, 2.3–2.7 mm long, light brown, glabrous. Embryo 0.25–0.35 length of caryopsis. Hilum linear, 0.3–0.4 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, South Australia, Tasmania, Victoria. Southern. Tablelands.

Amphibromus vickeryae S.W.L. Jacobs & L. Lapinuro. *Telopea* 2(6): 725 (1986).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Helictotrichon*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: Western Australia: Darling: Beechboro, 3 mi [5 km] N of Guildford, Dec 1901, *Fitzgerald s.n.* (NSW-117393).

Illustrations (Books): A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (135, Fig. 20), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): in honor of Joyce Winifred Vickery (1908–1979) Australian botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–100 cm long, 1–3 mm diam., 4–5 -noded. Culm-internodes terete or elliptical in section, ridged, smooth. Culm-nodes glabrous. Leaf-sheaths ribbed, smooth or scaberulous. Ligule an eciliate membrane, 9–12 mm long, acute. Leaf-blades 15–35 cm long, 3–4 mm wide. Leaf-blade surface ribbed, grooved adaxially or abaxially, scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, 7–15 cm long. Primary panicle branches 2–3 -nate, 2–5 cm long. Panicle branches flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 5–10 mm long.

Fertile Spikelets. Spikelets comprising 3–4 fertile florets, with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 8–11 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3.2–3.4 mm long, 0.9 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acute. Upper glume lanceolate, 3.6–4 mm long, 0.7 length of adjacent fertile lemma, membranous, 1-keeled, 5 -veined. Upper glume apex acute.

Florets. Fertile lemma elliptic, 5–5.5 mm long, cartilaginous, without keel, 7 -veined, more than 3-veined. Lemma surface scabrous, rough on veins. Lemma apex dentate, 4 -fid, with simple equal lobes or with outer lobes shorter, with lobes 0.5–1 mm long, awned, 5 -awned. Principal lemma awn dorsal, arising 0.5–0.55 way up back of lemma, geniculate, flat below, 10–12 mm long overall, with 6–7.5 mm long limb, with twisted column. Column of lemma awn 4–5 mm long, scabrous. Lateral lemma awns present, arising on apex of lobes, 0.5 mm long, shorter than principal. Palea 0.8 length of lemma. Palea keels ciliate. Palea surface papillose. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 0.98–1.12 mm long, membranous, glabrous, acute. Anthers 3, 1.7–1.8 mm long, eventually exerted. Ovary glabrous. Caryopsis with adherent pericarp, 1.9 mm long, dark brown, glabrous. Embryo 0.35 length of caryopsis. Hilum linear, 0.3–0.35 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia. South-West.

Amphibromus whitei C. E. Hubbard. *Kew Bull.* 1941, 30 (1941).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Helictotrichon*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: Queensland: Maranoa District: Roma, on edge of large fresh-water swamp, 25 Oct 1933, *White 9580* (HT: K; IT: BRI).

Illustrations (Books): J.C.Tothill,& J.B.Hacker. *The grasses of southern Queensland* (1983) (92), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): in honor of Cyril Tenison White (1890–1950) Australian botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Culms erect or geniculately ascending, 20–35 cm long, 3 -noded. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths scaberulous. Ligule an eciliate membrane, 5–8 mm long. Leaf-blades 7–15 cm long, 1–1.8 mm wide. Leaf-blade surface glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 5–10 cm long, 1–1.5 cm wide. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 4–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 7–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes pilose, hairy above. Floret callus pubescent.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 2–2.3 mm long, 0.7–0.8 length of upper glume, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume ovate, 2.5–3 mm long, 0.6–0.7 length of adjacent fertile lemma, membranous, without keels, 3 -veined. Upper glume apex acute.

Florets. Fertile lemma ovate, 4–4.5 mm long, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma surface papillose or tuberculate. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 8–12 mm long overall, with twisted column. Palea keels winged, narrowly winged, ciliolate, adorned above. Rhachilla extension 0.75 length of fertile floret. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 1–3, 0.3–0.5 mm long. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland.

Inland.

Amphicarpum amphicarpon (Pursh) Nash. *Mem. Torrey Bot. Club*, 5: 352 (1894).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Milium amphicarpon* Pursh, *Fl. Am. Sept.*1: 62 (1814). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: USA: New Jersey: near Egg Harbour: light sandy fields,.

Recent Synonyms: *Amphicarpon purshii* Kunth, *Gram.*1: 28. (1829).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (388).

Derivation (Clifford & Bostock 2007): Gk. *amphi-*, both; *karpos*, fruit. Inflorescences with both aerial and subterranean spikelets.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Annual. Culms erect, 30–80 cm long. Leaf-sheaths hispid. Ligule a fringe of hairs. Leaf-blades linear or lanceolate, 10–15 cm long, 5–15 mm wide. Leaf-blade surface pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade margins tuberculate-ciliate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 3–20 cm long, contracted about primary branches. Primary panicle branches 1.5–12 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, scabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, acuminate, 7–8 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, shorter than spikelet, thinner than fertile lemma. Upper glume lanceolate, 0.9 length of adjacent fertile lemma, membranous, without keels, 7 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of spikelet, membranous, 5 -veined, acute. Fertile lemma oblong, 7–8 mm long, indurate, much thinner on margins, without keel, 5 -veined, more than 3-veined. Lemma margins flat. Lemma apex apiculate. Palea indurate.

Flower and Fruit. Cleistogenes present, underground.

Distribution (TDWG). Continent. North America.

Country /Province /State. **Northeast USA** and **Southeastern USA.** New Jersey. Florida, North Carolina, South Carolina.

Amphicarpum muhlenbergianum (Schult.) Hitchcock. *Bartonia* 14, 34 (1932).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Milium muhlenbergianum* Schult., *Mant.* 2: 178 (1824). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: USA: South Carolina or Florida [no loc. cited],.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (388).

Derivation (Clifford & Bostock 2007): L. *-anus*, indicating connection. In honor of Gotthilf Heinrich Ernst Muhlenberg (1753–1815) a United States preacher, teacher and botanist.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Boivinellinae.

Habit, Vegetative Morphology. Perennial. Cataphylls evident. Rhizomes elongated. Culms erect or geniculately ascending, 10–70 cm long, rooting from lower nodes. Lateral branches sparse. Leaves cauline. Leaf-sheaths ribbed, hispid. Ligule a fringe of hairs. Leaf-blade base simple or broadly rounded. Leaf-blades lanceolate, (0.5–)3–10 cm long, 5–10 mm wide, herbaceous to coriaceous. Leaf-blade surface smooth or scaberulous, glabrous. Leaf-blade margins cartilaginous.

Inflorescence. Inflorescence a panicle or composed of racemes. Panicle open, lanceolate, 10–25 cm long, contracted about primary branches. Primary panicle branches distant, 1 -nate, indistinct the panicle almost racemose or simple, 1.5–15 cm long. Panicle branches scaberulous. Racemes 1–4, single or borne along a central axis, 1.5–15 cm long. Central inflorescence axis 5–10 cm long. Spikelets ascending or appressed, solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 1–8 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, acuminate, 6–7 mm long, falling entire.

Glumes. Glumes dissimilar, reaching apex of florets or shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 1 mm long, 0.1–0.2 length of spikelet, membranous or scarious, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume lanceolate, 0.9–1 length of adjacent fertile lemma, membranous, without keels, 5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of spikelet, membranous, without keels, 5 -veined, acute. Fertile lemma elliptic, 5.5–6 mm long, coriaceous or indurate, without keel, 5 -veined, more than 3-veined. Lemma lateral veins transversely connected at apex. Lemma margins involute. Lemma apex apiculate. Palea elliptic, 1 length of lemma, indurate, 2 -veined. Palea surface papillose. Palea apex acuminate.

Flower and Fruit. Lodicules 2, cuneate, 0.5 mm long, fleshy. Anthers 3, 4 mm long. Stigmas 2. Ovary glabrous.

Cleistogenes present, underground.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA. Alabama, Florida, Georgia, South Carolina.

Amphipogon amphipogonoides (Steud.) Vickery. *Contrib. N. S. Wales Nat. Herb.* 1: 286 (1950).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Pentacraspedon amphipogonoides* Steud., *Syn. Pl. Glumac.* 1: 151 (1854). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: King George Sound, W.A., *ex herb. D'Urville*; holotype: P; iso: K.

Illustrations (Books): C.A.Gardner, *Flora of Western Australia*, Vol 1, Part 1, *Gramineae* (1952) (136, Pl. 41), C.A.Gardner, *Flora of Western Australia*, Vol 1, Part 1, *Gramineae* (1952).

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Gk. *amphi-*, double; pogon, beard. Both lemmas have several awns arising from incisions at their apices.

Classification. Subfamily Arundinoideae. Tribe: Amphipogoneae.

Habit, Vegetative Morphology. Perennial. Rhizomes short. Culms erect or geniculately ascending, 20–40 cm long, 3–6 -noded. Culm-nodes glabrous. Ligule a fringe of hairs. Leaf-blades filiform, involute, 5–15 cm long, 1–2 mm wide, stiff. Leaf-blade surface scaberulous, rough abaxially. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle capitate, ovate, 1–1.5 cm long. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–7 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface villous. Lower glume apex acuminate. Upper glume lanceolate, 5–7 mm long, 1.4–1.8 length of adjacent fertile lemma, membranous, without keels, 3 -veined. Upper glume surface villous. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 3.5–4 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface pilose. Lemma margins involute. Lemma apex lobed, 3 -fid (or the laterals with a subsidiary outer lobe), incised 0.4–0.5 of lemma length, acuminate. Palea oblong, 1 length of lemma, coriaceous, 2 -veined, without keels. Palea surface pilose. Palea apex lobed, 4 -fid, acuminate.

Flower and Fruit. Anthers 3, 2–2.5 mm long. Caryopsis with free soft pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia. South-West.

Amphipogon avenaceus R. Br. *Prod.* 175 (1810).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *R. Brown* 6229, no date, Australia: Western Australia, New Holland (BM; IT: US-75457 (fragm. ex BM)).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): L. *-acea*, resembling. With inflorescences and/or spikelets similar to those of *Avena*.

Classification. Subfamily Arundinoideae. Tribe: Amphipogoneae.

Habit, Vegetative Morphology. Perennial. Rhizomes short, scaly. Culms erect or geniculately ascending, 20–35 cm long, 3–5 -noded. Ligule a fringe of hairs. Leaf-blades filiform, involute, 5–15 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle spiciform, oblong, 4 cm long, 1 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, linear, 1–3 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 12–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5–2.5 mm long, pubescent, acute. Floret callus hairs 0.2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 12–13 mm long, 1.2 length of upper glume, scarious, much thinner on margins, without keels, 3 -veined. Lower glume apex setaceously acuminate. Upper glume lanceolate, 10–12 mm long, 1.2 length of adjacent fertile lemma, scarious, with membranous margins, without keels, 3 -veined. Upper glume apex setaceously acuminate.

Florets. Fertile lemma oblong, 8–9 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface pubescent, hairy all along. Lemma margins involute. Lemma apex lobed, 3 -fid, with margins splitting into evanescent supplementary lobes, incised 0.5–0.6 of lemma length, awned, 3 -awned. Principal lemma awn 4 mm long overall. Lateral lemma awns present, arising on apex of lobes, 4 mm long, subequal to principal. Palea oblong, 2 -veined, without keels. Palea surface pubescent, hairy on back, hairy above. Palea apex lobed, 2 -fid, acuminate, awned.

Flower and Fruit. Anthers 3, 5 mm long. Caryopsis with free soft pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia. South-West.

Amphipogon caricinus F. Muell. *Linnaea* 25: 445 (1852).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: LT: *Mueller s.n.*, Nov. 1851, Australia: South Australia (MEL). LT designated by Vickery, *Contr. New South Wales Herb.* 1(5): 289 (1950).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (282, Fig. 218 as var. *caricinus*), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (120), K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (14, Fig. 2), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002), R.Pilger, *Die Natürlichen Pflanzenfamilien* 14d (1956) (125, Fig. 32).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): *L. carex*, reed-grass; -inus, belonging to. Similar to *Carex*.

Classification. Subfamily Arundinoideae. Tribe: Amphipogoneae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths pubescent. Culms erect, 20–50 cm long, 4 -noded. Ligule a fringe of hairs. Leaf-blades convolute, 10–15 cm long, 2–3 mm wide. Leaf-blade surface ribbed, scaberulous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle spiciform, oblong, 2–4(–6) cm long. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Panicle axis glabrous or pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong, 0.5–2 mm long.

Sterile Spikelets. Basal sterile spikelets absent or rudimentary.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 4.5–6 mm long, 0.75–0.9 length of upper glume, chartaceous, without keels, 3 -veined. Lower glume surface scabrous. Lower glume apex acute. Upper glume ovate, 6–7 mm long, 1.2 length of adjacent

fertile lemma, chartaceous, without keels, 3 -veined. Upper glume surface scabrous. Upper glume apex acute.

Florets. Fertile lemma oblong, gibbous, 5–6 mm long, coriaceous, much thinner on margins, without keel, 3 -veined, 0–3 -veined. Lemma midvein pubescent, hairy below (in 2 lines). Lemma surface glabrous or pubescent. Lemma margins involute. Lemma apex lobed, 3 -fid, with margins splitting into evanescent supplementary lobes, incised 0.5 of lemma length, awned, 3 -awned. Principal lemma awn 2.5–3 mm long overall, limb glabrous or ciliate. Lateral lemma awns present, arising on apex of lobes, 2.5–3 mm long, subequal to principal, glabrous or ciliate. Palea oblong, 2 -veined, without keels. Palea apex lobed, 2 -fid, acuminate, awned, awns glabrous or hairy.

Flower and Fruit. Anthers 3, 3 mm long. Caryopsis with free soft pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Lord Howe-Norfolk Is, New South Wales, Northern Territory, Queensland, South Australia, Victoria, Western Australia.

Kimberley, Ereman, South-West. Victoria R & Barkly Tableland, Central Australia. NW & Lake Eyre, Southern. North, Central, South East, Inland. Western Slopes, Western Plains.

Amphipogon debilis R. Br. *Prod.* 1: 175. (1810).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: R. Brown 6228, no date, Australia: Western Australia: New Holland (BM; IT: K, US-75456 (fragm. ex BM)).

Illustrations (Books): C.A.Gardner, *Flora of Western Australia*, Vol 1, Part 1, *Gramineae* (1952) (135, Pl. 40), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): L. weak. Culms decumbent often much branched at the base.

Classification. Subfamily Arundinoideae. Tribe: Amphipogoneae.

Habit, Vegetative Morphology. Perennial. Culms geniculately ascending or decumbent, 10–20 cm long, 3–5 -noded. Culm-nodes glabrous. Ligule a fringe of hairs, 0.5–1 mm long. Leaf-blades filiform, involute, 1–12 cm long, 1–2 mm wide, stiff. Leaf-blade surface smooth or scaberulous, rough abaxially. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Peduncle pubescent above. Panicle capitate, oblong, 1–2 cm long. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 7–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pubescent.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 4.5 mm long, 1.3 length of upper glume, membranous, much thinner on margins, without keels, 3 -veined. Lower glume margins ciliolate. Lower glume apex dentate, 3 -fid. Upper glume ovate, 3.5 mm long, 0.3–0.5 length of adjacent fertile lemma, membranous, with hyaline margins, without keels, 3 -veined. Upper glume margins ciliolate. Upper glume apex dentate, 3 -fid.

Florets. Fertile lemma lanceolate, 7–10 mm long, cartilaginous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface scabrous. Lemma margins involute. Lemma apex lobed, 3 -fid, incised 0.6–0.7 of lemma length, setaceously acuminate. Palea linear, 0.9 length of lemma, cartilaginous, 2 -veined. Palea keels scaberulous. Palea apex lobed, 2 -fid, acuminate, awned.

Flower and Fruit. Anthers 3. Caryopsis with free soft pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia. South-West.

Amphipogon laguroides R. Br. *Prod.* 1: 175. (1810).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *R. Brown 6225*, no date, Australia: Western Australia: New Holland (BM; IT: K, US-75455 (fragm. ex BM)).

Illustrations (Books): C.A.Gardner, *Flora of Western Australia*, Vol 1, Part 1, *Gramineae* (1952) (135, Pl. 40), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Images: K.O.Mallett (ed.). *Flora of Australia*, Vol 44 A (2002) & Vol 44B (2004). *Poaceae*;

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Resembling *Lagurus* in respect of the inflorescence.

Classification. Subfamily Arundinoideae. Tribe: Amphipogoneae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent or short. Butt sheaths glabrous or sparsely hairy. Culms erect, 25–30 cm long, 4–5 -noded. Ligule a fringe of hairs, 0.5–2 mm long. Leaf-blades flexuous, convolute, 10–20 cm long, 2–3 mm wide, stiff. Leaf-blade surface ribbed, scaberulous, rough abaxially, pubescent, hairy adaxially. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle capitate, ovate or globose, 1–1.5 cm long. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Spikelets solitary. Fertile spikelets sessile.

Sterile Spikelets. Basal sterile spikelets rudimentary.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 5–6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–6 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface pilose, with tubercle-based hairs. Lower glume apex setaceously acuminate. Upper glume lanceolate, 5–6 mm long, 1.2 length of adjacent fertile lemma, membranous, without keels, 3 -veined. Upper glume surface pilose, with tubercle-based hairs. Upper glume apex setaceously acuminate.

Florets. Fertile lemma oblong, 4–5 mm long, coriaceous, without keel, 7 -veined, 0–3 -veined. Lemma surface pubescent, hairy below, hairy between veins. Lemma margins involute. Lemma apex lobed, 3 -fid, incised 0.5 of lemma length, awned, 3 -awned. Principal lemma awn 5–6 mm long overall. Lateral lemma awns present, arising on apex of lobes, 5–6 mm long, shorter than principal. Palea oblong, 2 -veined, without keels. Palea surface pubescent, hairy on flanks. Palea apex lobed, 2 -fid, acuminate, awned.

Flower and Fruit. Anthers 3. Caryopsis with free soft pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia. South-West.

Amphipogon sericeus (Vickery)T. Macfarlane. *Fl. Australia* 43: 375 (2002).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Australia. **Basionym or Replaced Name:** *Amphipogon caricinus* var. *sericeus* Vickery, *Contr. New South Wales Natl. Herb.* 1: 290 (1950). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: Queensland: Mt. Howitt Station, about eighty miles W. of Eromanga on drifted sand, *S.T. Blake 4/7/1936* (HT: STB-12064; IT: NSW-2708).

Derivation (Clifford & Bostock 2007): *L. sericeus*, silken; *-eal*, indicating resemblance. Densely invested in part or totally with long hairs.

Classification. Subfamily Arundinoideae. Tribe: Amphipogoneae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short. Basal innovations intravaginal. Culms erect, 30–60 cm long. Ligule a fringe of hairs. Leaf-blades flat, 8–15 cm long, 2–2.5 mm wide. Leaf-blade surface pubescent to hirsute, sparsely hairy.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 3.5–6 cm long, 0.7–2 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Sterile Spikelets. Basal sterile spikelets absent.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets oblong, laterally compressed, 10–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, 0.6–0.7 mm long, acute.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 6.5 mm long, 1 length of upper glume, chartaceous, without keels, 3 -veined. Lower glume surface scabrous, glabrous or hirsute, hairy above. Lower glume apex obtuse. Upper glume ovate, 6.5 mm long, chartaceous, without keels. Upper glume surface scabrous, glabrous or hirsute, hairy above. Upper glume apex obtuse.

Florets. Fertile lemma oblong, 6–8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface pubescent (body) or plumose (lobes). Lemma margins involute. Lemma apex lobed, 3 -fid, incised 0.5 of lemma length, awned, 3 -awned. Principal lemma awn 2.5–4.5 mm long overall. Lateral lemma awns present, arising on apex of lobes, 2.5–4.5 mm long, subequal to principal.

Flower and Fruit. Anthers 3, 4.5 mm long.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, Northern Territory, Queensland. Ereman. Victoria R & Barkly Tableland, Central Australia. Central, Inland.

Amphipogon setaceus (R.Br.)T.Macfarlane. *Fl. Australia* 43: 374 (2002).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Diplopogon*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006) (as *Diplopogon*), D.Sharp, D. & B.K.Simon, *AusGrass* (2002) (as *Diplopogon*).

TYPE from Australia. **Basionym or Replaced Name:** *Diplopogon setaceus* R.Br., *Prodromus Florae Novae Hollandiae* 176 (1810). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia, King George's Sound: Brown (BM holo, K).

Illustrations (Books): C.A.Gardner, *Flora of Western Australia*, Vol 1, Part 1, *Gramineae* (1952) (as *Diplopogon*), K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (14, Fig. 2), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002) (as *Diplopogon*).

Derivation (Clifford & Bostock 2007): *L. seta*, bristle; *-acea*, indicating resemblance. With bristle-like leaf-blades.

Classification. Subfamily Arundinoideae. Tribe: Amphipogoneae.

Habit, Vegetative Morphology. Perennial. Culms 30–60 cm long. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 15–25 cm long, 1 mm wide. Leaf-blade surface ribbed.

Inflorescence. Inflorescence a panicle. Panicle capitate, globose, 1–2.5 cm long. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Spikelets solitary. Fertile spikelets pedicelled. Pedicels absent.

Sterile Spikelets. Basal sterile spikelets absent or rudimentary, 0–3 in number.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 7 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute, awned, 1 -awned, awn 2.5–3 mm long. Upper glume elliptic, 7 mm long, 1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute, awned, 1 -awned, awn 3–5 mm long.

Florets. Fertile lemma elliptic, 5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins involute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn geniculate, 4–5 mm long overall, with twisted column. Lateral lemma awns present, 2–2.5 mm long, shorter than principal. Palea 1 length of lemma, 2 -veined, without keels. Palea apex dentate, 2 -fid, awned, awns 2 mm long.

Flower and Fruit. Anthers 3, 2–3.5 mm long. Caryopsis with tardily free pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia. South-West.

Amphipogon strictus R. Br. *Prod.* 1: 175 (1810).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *R. Brown 6227*, no date, Australia: New South Wales (BM; IT: K, US-75453 (fragm. ex BM)).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (283, Fig. 219 as var. *setifer*), C.A.Gardner, *Flora of Western Australia*, Vol 1, Part 1, *Gramineae* (1952) (135, Pl. 40), J.R.Wheeler et al, *Flora of the Kimberley Region* (1992) (as var. *setifer*), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (547, Fig. 108), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (120 as var. *strictus*), J.C.Tothill,& J.B.Hacker. *The grasses of southern Queensland* (1983) (94), T.D.Stanley & E.Ross, *Flora of South East Queensland, Gramineae* (1989) (145, Fig. 22), K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (14, Fig. 2), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. erect*. Inflorescence branches erect.

Classification. Subfamily Arundinoideae. Tribe: Amphipogoneae.

Habit, Vegetative Morphology. Perennial. Rhizomes short. Culms erect or geniculately ascending, 25–35 cm long, 3-noded. Culm-nodes glabrous. Leaves basal and cauline. Ligule a fringe of hairs. Leaf-blades convolute, 1–15 cm long, 2 mm wide, stiff. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle spiciform or capitate, oblong, 1–2 cm long, 0.5 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Sterile Spikelets. Basal sterile spikelets absent or rudimentary, 0–3 in number.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 8–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pubescent, disarticulating obliquely.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 4–6 mm long, 0.8 length of upper glume, membranous, without keels, 3-veined. Lower glume apex acute. Upper glume ovate, 5–7 mm long, 0.8 length of adjacent fertile lemma, membranous, without keels, 3-veined. Upper glume apex acute.

Florets. Fertile lemma oblong, 6–8 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma midvein pubescent, hairy below (in 2 lines). Lemma surface pubescent, hairy below, hairy on veins. Lemma margins involute. Lemma apex lobed, 3-fid, with lanceolate lobes, incised 0.66 of lemma length, acute, awned, 3-awned. Principal lemma awn 2–3.5 mm long overall, limb ciliate, glabrescent towards tip. Lateral lemma awns present, arising on apex of lobes, 2–3.5 mm long, subequal to principal, ciliate. Palea oblong, 0.9 length of lemma, 2-veined, without keels. Palea apex dentate, 2-fid, acuminate, awned, awns 2 mm long, awns hairy.

Flower and Fruit. Anthers 3, 3.5–4 mm long. Caryopsis with free soft pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. **Australia.** New South Wales, Northern Territory, Queensland, South Australia, Victoria, Western Australia.

South-West. Southern. South East. Coast, Tablelands.

Amphipogon turbinatus R. Br. *Prod.* 1: 175 (1810).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

Illustrations (Books): C.A.Gardner, *Flora of Western Australia*, Vol 1, Part 1, *Gramineae* (1952) (136, Pl. 41), K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (14, Fig. 2), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): *L. turbo*, a top; -ata, possessing. Spikelets top-shaped.

Classification. Subfamily Arundinoideae. Tribe: Amphipogoneae.

Habit, Vegetative Morphology. Perennial. Cataphylls evident. Rhizomes short. Butt sheaths glabrous or woolly. Culms erect or geniculately ascending, 30–50 cm long. Culm-nodes glabrous. Ligule a fringe of hairs. Leaf-blades curved, filiform, involute, 10–15 cm long, 2–3 mm wide. Leaf-blade surface ribbed, pubescent, hairy adaxially. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle capitate, obovate, 1.5 cm long, 1.5 cm wide. Primary panicle branches accrescent to a central axis, with evident branchlets on axis. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong, 0.5 mm long.

Sterile Spikelets. Basal sterile spikelets rudimentary.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 8–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2–3 mm long, pubescent, pungent. Floret callus hairs 0.2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–10 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface pilose, hairy above. Lower glume apex acuminate, awned, 1 -awned, awn 4–6 mm long. Upper glume lanceolate, 8–10 mm long, 1.2 length of adjacent fertile lemma, membranous, without keels, 3 -veined. Upper glume surface pilose, hairy above. Upper glume apex acuminate, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma oblong, 6–8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface pubescent, hairy all along. Lemma margins involute. Lemma apex lobed, 3 -fid, with margins splitting into evanescent supplementary lobes, incised 0.3–0.6 of lemma length, awned, 3 -awned. Principal lemma awn 6–8 mm long overall. Lateral lemma awns present, arising on apex of lobes, 6–8 mm long, subequal to principal. Palea oblong, 2 -veined, without keels. Palea surface pubescent, hairy on flanks. Palea apex lobed, 2 -fid, acuminate, awned, awns 6–8 mm long.

Flower and Fruit. Anthers 3. Caryopsis with free soft pericarp, obovoid, 2.5 mm long.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia. South-West.

Anadelphia afzeliana (Rendle) Stapf. Prain, *Fl. Trop. Afr.* 9 : 397 (1919).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Sierra Leone. **Basionym or Replaced Name:** *Andropogon afzelianus* Rendle, *J. Bot.* 31: 357 (1893). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: In Sierra Leone, and designated *Andropogon* 2 in 1792–1794, *Afzelius s.n.*

Illustrations (Books): H.Jacques-Felix, *Les Graminees d'Afrique tropicale* (1962) (307, Fig. 245 as *Pobeguinea arrecta*).

Illustrations (Journals): *Hooker's Icones Plantarum* (t.3090 (1922) as *A. arrecta*).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Adam Afzelius (1750–1837) Swedish botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Perennial. Culms erect, 100–200 cm long. Ligule a ciliate membrane. Leaf-blades 10–25 cm long, 2–4 mm wide.

Inflorescence. Synflorescence compound, paniculate, 25–45 cm long, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, enclosed. Spatheole linear, 2–3.5 cm long, scarious. Peduncle pubescent above. Racemes 1, single, 1.5–2 cm long, bearing few fertile spikelets, bearing 2 fertile spikelets on each. Rhachis fragile at the nodes, ciliate on margins. Spikelet packing lax. Rhachis internodes filiform, 4–5 mm long. Rhachis internode tip oblique. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas or male, linear to lanceolate, 6–9 mm long, longer than fertile, separately deciduous. Companion sterile spikelet callus oblong, 2-toothed. Companion sterile spikelet glumes coriaceous, 7–9 -veined, glabrous, acuminate, mucous or mucronate. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, subterete, 5–8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus linear, 1.5–2.5 mm long, pilose, base pungent, attached obliquely. Spikelet callus hairs white.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume oblong, 1 length of spikelet, coriaceous, dark brown, without keels, keel-less except near apex, 6–7 -veined. Lower glume lateral veins obscure. Lower glume apex entire, truncate. Upper glume oblong, without keels, 1–3 -veined. Upper glume margins ciliate. Upper glume apex entire, obtuse, awned, 1 -awned, awn 8–15 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined, ciliate on margins. Fertile lemma linear, 4–6 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.3–0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 25–40 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. *n* = 10 (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa. Benin, Burkina, Ghana, Guinea-Bissau, Guinea, Ivory Coast, Mali, Nigeria, Senegal, Sierre Leone, Togo. Congo, DRC.

Anadelphia bigeniculata W. D. Clayton. *Kew Bull.* 20: 283 (1966).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Guinea. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Dalaba: *Adames 390* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. bis*, twice; geniculata, kneed. Awn of lemma bent in two places.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Annual. Culms 30–60 cm long. Ligule a ciliolate membrane, 1–2 mm long, truncate or acute. Leaf-blades 8–30 cm long, 1–2 mm wide. Leaf-blade surface scaberulous. Leaf-blade margins scaberulous.

Inflorescence. Synflorescence compound, paniculate, 15–25 cm long, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, exerted. Spatheole linear, 1.5–2.5 cm long, scarios. Peduncle 2–3 cm long, scaberulous above. Racemes 1, single, 1 cm long, bearing few fertile spikelets, bearing 2–4 fertile spikelets on each. Rhachis fragile at the nodes, ciliate on margins. Spikelet packing lax. Rhachis internodes filiform, 2 mm long. Rhachis internode tip oblique. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, ciliate.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels or well-developed, male, lanceolate, 5 mm long, as long as fertile, separately deciduous. Companion sterile spikelet callus cuneate, 0.5 mm long, obtuse. Companion sterile spikelet glumes coriaceous, glabrous, setaceously acuminate, muticous. Companion sterile spikelet lemmas 2, enclosed by glumes, 3 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus square or oblong, 0.2 mm long, pilose, base obtuse, attached obliquely. Spikelet callus hairs dark brown.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume oblong, 1 length of spikelet, coriaceous, dark brown, without keels, 7 -veined. Lower glume lateral veins obscure. Lower glume surface asperulous, rough above. Lower glume apex dentate, 2 -fid. Upper glume oblong, without keels, 3 -veined. Upper glume apex entire, awned, 1 -awned, awn 3.5–6 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3 mm long, hyaline, 2 -veined, ciliate on margins. Fertile lemma linear, 3 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, incised 0.25 of lemma length, awned, 1 -

awned. Principal lemma awn from a sinus, bigeniculate, 14–22 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Lodicules 2, cuneate, 0.2 mm long, fleshy, truncate. Anthers 3, 1.5–1.8 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Guinea, Sierre Leone.

Anadelphia chevalieri Reznik. *Rev. Bot. Appliq.* 14: 199. (1934).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Guinea. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Kindia: *Jacques-Felix 351d*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Jean Baptiste Auguste Chevalier (1873–1956) French botanist and collector in tropical Africa, SE Asia and Brazil.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Annual. Culms 100 cm long. Ligule a ciliate membrane.

Inflorescence. Synflorescence compound, scanty, 10–30 cm long.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, enclosed. Spatheole lanceolate, 4.5–5.5 cm long, scarious, purple. Racemes 1, single, 3 cm long, bearing few fertile spikelets, bearing 2 fertile spikelets on each. Rhachis fragile at the nodes, ciliate on margins. Spikelet packing lax. Rhachis internodes filiform. Rhachis internode tip oblique. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 5 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 15–25 mm long, longer than fertile, separately deciduous. Companion sterile spikelet callus oblong, 1 mm long, 2-toothed or emarginate. Companion sterile spikelet glumes coriaceous, glabrous, setaceously acuminate, awned, one glume awned, with 1–3 mm long awn. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 10–13 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus linear, curved, 3–4 mm long, pubescent, base pungent, attached obliquely. Spikelet callus hairs white.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, coriaceous, dark brown, without keels, 6–7 -veined. Lower glume lateral veins obscure. Lower glume apex entire, truncate. Upper glume oblong, coriaceous, without keels. Upper glume apex entire, awned, 1 -awned, awn 7–14 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined, ciliate on margins. Fertile lemma oblong, 4.5 mm long, membranous, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, incised 0.4–0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, bigeniculate, 50–70 mm long overall, with twisted column. Column of lemma awn 20–22 mm long, glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Guinea.

Anadelphia funerea (Jacques-Felix) W. D. Clayton. *Kew Bull.* 20: 281 (1966).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. relating to a funeral. Lemma-awn black.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 60–100 cm long. Ligule an eciliate membrane, 1–1.3 mm long. Leaf-blades 4–10 cm long, 1–3 mm wide. Leaf-blade apex acuminate.

Inflorescence. Synflorescence compound, linear, 10–40 cm long.

Inflorescence comprising only a few spikelets, comprising 1 fertile spikelets, terminal and axillary, subtended by a spatheole, enclosed. Spatheole linear, 2–3 cm long, scarious. Spikelets in threes. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 2 in the cluster. Pedicels present, filiform, 2.5 mm long, ciliate, with red hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, subterete, 10–11 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus linear, 2 mm long, pubescent, base pungent, attached obliquely. Spikelet callus hairs red.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 0.9 length of spikelet, coriaceous, dark brown, without keels, 6–7 -veined. Lower glume lateral veins obscure. Lower glume surface puberulous, hairy above. Lower glume apex entire, emarginate. Upper glume oblong, coriaceous, without keels. Upper glume apex entire, acute, mucicous or mucronate, 1 -awned, awn 8–15 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined, ciliate on margins. Fertile lemma linear, 4 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, incised 0.25 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 100–120 mm long overall, with twisted column (black). Column of lemma awn 75–90 mm long, glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Guinea.

Anadelphia hamata Stapf. Prain, *Fl. Trop. Afr.* 9: 395 (1919).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Guinea. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Coll? (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. hamus*, hook; -ata, possessing. Lemma awn slender with an abruptly deflexed bristle.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Perennial. Culms 60–90 cm long. Ligule a ciliolate membrane, 0.5 mm long. Leaf-blades 6–15 cm long, 2–4 mm wide, flaccid. Leaf-blade surface pubescent.

Inflorescence. Synflorescence compound, scanty, 10–30 cm long.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, exserted. Spatheole linear, 2–3 cm long, scarious. Peduncle 3–5 cm long, pubescent above. Racemes 1, single, 1.8–2 cm long, bearing few fertile spikelets, bearing 2–4 fertile spikelets on each. Rhachis fragile at the nodes, ciliate on margins. Spikelet packing lax. Rhachis internodes filiform, 4–5 mm long. Rhachis internode tip oblique. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 4–5 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 5–6.5 mm long, shorter than fertile, separately deciduous. Companion sterile spikelet callus oblong or cuneate, 0.7–1 mm long, 2-toothed or emarginate. Companion sterile spikelet glumes chartaceous, 9 -veined, glabrous, acuminate, mucronate or awned, with 0.5–1.5 mm long awn. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear or lanceolate, dorsally compressed, 6–7.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus cuneate, 1.5–2.5 mm long, pubescent, base acute, attached obliquely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, chartaceous, without keels, 6–7 -veined. Lower glume lateral veins distinct. Lower glume apex dentate, 2 -fid. Upper glume oblong, without keels. Upper glume margins ciliate. Upper glume apex entire, emarginate, awned, 1 -awned, awn 2–3 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 1 length of fertile lemma, hyaline, 2 -veined, ciliate on margins, obtuse. Fertile lemma linear, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, incised 0.33 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 12–20 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3, 3 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa. Congo, Gabon, DRC.

Anadelphia leptocoma (Trin.) Pilger. *Bot. Jahrb.* 54:284 (1917).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Sierra Leone. **Basionym or Replaced Name:** *Andropogon leptocomus* Trin., *Mem. Acad. Petersb. Ser.* 6(2): 264. (1832).

Illustrations (Books): H.Jacques-Felix, *Les Graminees d'Afrique tropicale* (1962) (309, Fig. 247 as *A. longifolia*).

Derivation (Clifford & Bostock 2007): Gk. *leptos*, narrow; kome, hair of the head. Pedicels of stalked spikelets hairy.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Perennial. Culms erect, 100–150 cm long. Ligule a ciliate membrane. Leaf-blades 15–30 cm long, 2–6 mm wide.

Inflorescence. Synflorescence compound, paniculate, 30–60 cm long, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 1.5–2 cm long, scarious. Racemes 1, single, 0.8–1.2 cm long, bearing few fertile spikelets, bearing 3–5 fertile spikelets on each. Rhachis fragile at the nodes, ciliate on margins. Spikelet packing lax. Rhachis internodes filiform, 2–6 mm long. Rhachis internode tip oblique. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, ciliate.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels or well-developed, containing empty lemmas or male, linear to lanceolate, as long as fertile, separately deciduous. Companion sterile spikelet callus cuneate, obtuse. Companion sterile spikelet glumes chartaceous, 7–9 -veined, glabrous, acuminate. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, subterete, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, attached obliquely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, chartaceous, without keels, keel-less except near apex, 4–9 -veined. Lower glume lateral veins distinct. Lower glume apex dentate, 2 -fid. Upper glume oblong, without keels, 1–3 -veined. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 2–5 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined, ciliate on margins. Fertile lemma linear, 4–6 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.3–0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8–16 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Ghana, Guinea, Ivory Coast, Liberia, Mali, Nigeria, Sierra Leone.

Anadelphia liebigiana H. Scholz. *Willdenowia* 7 (3): 583 (1975).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Togo. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Aledjo: *Mathey & Scholz* 390 (B holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Manfred Liebig (fl. 1912–74) German cleric and plant collector in Togo.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 80–100 cm long. Leaf-sheaths longer than adjacent culm internode, striately veined, glabrous on surface. Ligule an eciliate membrane, 0.5 mm long. Leaf-blades straight or curved, conduplicate, 1–2 mm wide. Leaf-blade surface scabrous, glabrous, hairless except near base. Leaf-blade margins scaberulous. Leaf-blade apex filiform.

Inflorescence. Synflorescence compound, paniculate, 25–30 cm long, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 2.5–4 cm long, scarious. Peduncle pilose above. Racemes 1, single, 2–3 cm long, bearing few fertile spikelets, bearing 6–10 fertile spikelets on each. Rhachis fragile at the nodes, ciliate on margins. Spikelet packing lax. Rhachis internodes filiform. Rhachis internode tip oblique. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, ciliate.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels or well-developed (2 spikelets per raceme), male, linear, 8–9.2 mm long, longer than fertile, separately deciduous. Companion sterile spikelet callus cuneate, obtuse. Companion sterile spikelet glumes coriaceous, 9 -veined, pilose, acuminate. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, subterete, 5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus 0.8 mm long, pilose, base obtuse, attached obliquely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, coriaceous, light brown, without keels, keel-less except near apex, 6–8 -veined. Lower glume surface pilose. Lower glume apex obtuse. Upper glume oblong, without keels. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 5 mm long.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret oblong, 3.8–4.5 mm long, hyaline, 2 -veined, obscurely veined, ciliolate on margins. Fertile lemma linear, 3.5–3.8 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–16 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Lodicules 2, oblong, 0.5 mm long, truncate.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Togo.

Anadelphia macrochaeta (Stapf) W. D. Clayton. *Kew Bull.* 20: 281 (1966).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Basionym or Replaced Name: *Monium macrochaetum* Stapf, Prain, *Fl. Trop. Afr.* 9: 400 (1919).

Illustrations (Journals): *Hooker's Icones Plantarum* (t.3091 (1922) as *Monium*).

Derivation (Clifford & Bostock 2007): Gk. *makros*, large; *chaete*, bristle. Lemmas long-awned.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Annual. Culms erect, 30–60 cm long. Ligule a ciliolate membrane. Leaf-blades 2.5–5 cm long, 0.5–1 mm wide.

Inflorescence. Synflorescence compound, linear, 10–20 cm long.

Inflorescence comprising only a few spikelets, comprising 1 fertile spikelets, terminal and axillary, subtended by a spatheole, enclosed. Spatheole linear, 1.8–2.5 cm long, scarious. Spikelets in threes. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 2 in the cluster. Pedicels present, filiform, 0.2–0.4 mm long, glabrous.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, subterete, 6–7 mm long, falling entire,

deciduous with accessory branch structures. Spikelet callus linear, 1.5 mm long, bearded, base pungent, attached obliquely. Spikelet callus hairs red.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume oblong, 1 length of spikelet, coriaceous, without keels, keel-less except near apex, 6–7 -veined. Lower glume lateral veins obscure. Lower glume apex dentate, 2 -fid. Upper glume oblong, without keels, 1–3 -veined. Upper glume apex dentate, 2 -fid, mucicous or mucronate, 1 -awned, awn 2–5 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 2–3 mm long, hyaline, 0 -veined, without midvein, without lateral veins, ciliate on margins. Fertile lemma linear, 3–3.5 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, with linear lobes, incised 0.25 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 45–60 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Guinea.

Anadelphia polychaeta W. D. Clayton. *Kew Bull.* 20: 281 (1966).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Senegal. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Diouloubou: *Adam 18222* (K holo).

Illustrations (Books): F.N.Hepper, *F.W.T.A.* 3(2) (1972) (500, Fig.458).

Derivation (Clifford & Bostock 2007): ultimate spikelet of inflorescence with several awns or awn-like structures.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Annual. Culms 80 cm long. Ligule a ciliolate membrane, 2 mm long, truncate. Leaf-blades 10–20 cm long, 1–2 mm wide. Leaf-blade apex attenuate, filiform.

Inflorescence. Synflorescence compound, scanty, 20–25 cm long.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, exserted. Spatheole linear, 3.5–4 cm long, scarious, glabrous. Peduncle 4–4.5 cm long, antrorsely scabrous above. Racemes 1, single, 1.5–2 cm long, bearing few fertile spikelets, bearing 2 fertile spikelets on each. Rhachis fragile at the nodes, ciliate on margins. Spikelet packing lax. Rhachis internodes filiform. Rhachis internode tip oblique. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, ciliate.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels or well-developed, male, linear, 6 mm long, as long as fertile, separately deciduous. Companion sterile spikelet callus cuneate, 1 mm long, truncate. Companion sterile spikelet glumes coriaceous, glabrous, acuminate, awned, both glumes awned, with 1–2 mm long awn. Companion sterile spikelet lemmas 2, enclosed by glumes, 4 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 6.5–7.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus cuneate, 1.8 mm long, pilose, base pungent, attached obliquely. Spikelet callus hairs red.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume oblong, 1 length of spikelet, coriaceous, dark brown, without keels, 7 -veined. Lower glume lateral veins obscure. Lower glume surface asperulous, rough above. Lower glume apex dentate, 2 -fid, awned, 2 -awned, awn 4–5.5 mm long. Upper glume oblong, without keels, 3 -veined. Upper glume apex entire, awned, 1 -awned, awn 8–12 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 4 mm long, hyaline, 2 -veined, ciliate on margins. Fertile lemma linear, 3.5 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, incised 0.25 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 20–40 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Lodicules 2, oblong, 0.5 mm long, fleshy, truncate. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Guinea, Senegal.

Anadelphia pumila Jacques-Felix. *Rev. Bot. Appliq.* . 178 (1950).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Guinea. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mont Gaugan, aretes humides des pentes greseuses, *Jacquesj-Felix 2075*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. dwarf, low growing. Habit typically depauperate.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Annual. Culms 15–60 cm long. Ligule a ciliolate membrane. Leaf-blades 2–8 cm long, 1–2 mm wide.

Inflorescence. Synflorescence compound, scanty, 4–20 cm long.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, exerted. Spatheole linear, 2–3 cm long, scarious. Racemes 1, single, 1.5–2.5 cm long, bearing few fertile spikelets, bearing 4–6 fertile spikelets on each. Rhachis fragile at the nodes, glabrous on margins. Spikelet packing lax. Rhachis internodes filiform. Rhachis internode tip oblique. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 1–2 mm long, glabrous.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 7–8 mm long, longer than fertile, separately deciduous. Companion sterile spikelet callus linear, 1–1.5 mm long, truncate or obtuse. Companion sterile spikelet glumes coriaceous, 3 -veined, glabrous, acuminate, muticous. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear or lanceolate, subterete, 3.5–4.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus cuneate, 1–1.5 mm long, pubescent, base truncate, attached obliquely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, coriaceous, without keels, 6–7 -veined. Lower glume lateral veins obscure. Lower glume surface asperulous, rough above. Lower glume apex dentate, 2 -fid. Upper glume oblong, without keels. Upper glume apex entire, awned, 1 -awned, awn 5–7 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, hyaline, 1 -veined, without lateral veins, eciliate on margins. Fertile lemma linear, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, incised 0.7–0.8 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–20 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Ghana, Guinea.

Anadelphia scyphofera W. D. Clayton. *Kew Bull.* 20: 278 (1966).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Zambia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Luwingu District: Chishinga Ranch, 17 May 1961, *Astle 647* (HT: K).

Illustrations (Books): G.V.Pope et al., *Flora Zambesiaca* 10 (4(2002):142, t. 45).

Derivation (Clifford & Bostock 2007): Gk. *skyphos*, cup; L. *fero*, bear. There is a trumpet-shaped appendage at the apex of the peduncle.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Annual. Culms erect, 10–40 cm long. Leaf-sheath auricles erect, 2–3 mm long. Ligule a ciliolate membrane. Leaf-blades filiform, 10–20 cm long, 0.5 mm wide.

Inflorescence. Synflorescence compound, fastigiate, 20–30 cm long.

Inflorescence comprising only a few spikelets, comprising 2 fertile spikelets, terminal and axillary, subtended by a spatheole, enclosed. Spatheole linear, 2.5–3.5 cm long, scarious. Peduncle expanded into a

conical flask at apex (2 mm long). Spikelets in threes. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 2 in the cluster. Pedicels present, filiform, 2 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, comprising 2 subequal glumes without lemmas, linear, 2–4 mm long, shorter than fertile, separately deciduous. Companion sterile spikelet callus linear, 0.25 mm long, truncate. Companion sterile spikelet glumes chartaceous, glabrous, acuminate.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, subterete, 6–7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus cuneate, 1.5 mm long, pilose, base pungent, attached obliquely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, chartaceous, without keels, keel-less except near apex, 6 -veined. Lower glume lateral veins distinct. Lower glume surface with a longitudinal median groove. Lower glume apex dentate, 2 -fid. Upper glume oblong, without keels, 3 -veined. Upper glume apex acute, awned, 1 -awned, awn 12–14 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined, ciliate on margins. Fertile lemma oblong, 3 mm long, hyaline, without keel. Lemma margins ciliate. Lemma apex lobed, 2 -fid, incised 0.2 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, bigenulate, 45–50 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, South Tropical Africa. DRC. Zambia.

Anadelphia trepidaria (Stapf) Stapf. Prain, *Fl. Trop. Afr.* 9: 390 (1919).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Guinea-Bissau. **Basionym or Replaced Name:** *Andropogon trepidarius* Stapf, *Journ. deBot.* 19: 100. (1905). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *C.H.O. Pobeguim 524*, no date, Guinea-Bissau: Koroussa (US-1038047 (ex K)).

Illustrations (Books): H.Jacques-Felix, *Les Graminees d'Afrique tropicale* (1962) (310, Fig. 248 as *Monium congestum*).

Derivation (Clifford & Bostock 2007): *L. trepidus*, restless; *-aria*, pertaining to. The inflorescence is lax and mobile in light winds.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Annual. Culms 30–60 cm long. Ligule a ciliolate membrane. Leaf-blades flat or involute, 3–8 cm long, 1 mm wide, flaccid. Leaf-blade surface glabrous.

Inflorescence. Synflorescence compound, paniculate, 15–30 cm long, lax.

Inflorescence comprising only a few spikelets, comprising 1 fertile spikelets, terminal and axillary, subtended by a spatheole, enclosed. Spatheole linear, 1.2–2 cm long, scarious, glabrous or pilose. Peduncle 0.4–0.8 cm long. Spikelets in threes. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 2 in the cluster. Pedicels present, filiform, 1.5 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels or well-developed, containing empty lemmas or male, lanceolate, 4.5–6 mm long, longer than fertile, separately deciduous. Companion sterile spikelet callus linear, 1.5–2 mm long, truncate. Companion sterile spikelet glumes coriaceous, 7–9 -veined, glabrous, acuminate, mucicous. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, subterete, 3.5–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus cuneate, 1 mm long, pubescent, base obtuse or acute, attached obliquely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, chartaceous, without keels, 5–7 -veined. Lower glume lateral veins distinct. Lower glume apex dentate, 2 -fid, mucronate. Upper glume lanceolate, without keels, 1–3 -veined. Upper glume apex entire, truncate, awned, 1 -awned, awn 6 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3 mm long, hyaline, 0–2 -veined, ciliate on margins, obtuse. Fertile lemma lanceolate, 2 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 20–30 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3, 3 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Guinea, Sierre Leone.

Anadelphia trichaeta (Reznik) W. D. Clayton. *Kew Bull.* 20 :281 (1966).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Guinea. **Basionym or Replaced Name:** *Monium trichaetum* Reznik, *Bull. Mus. Hist. Nat. Paris, Ser. 2(4)* : 1046. (1932). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *lix, H. Jacques-F 184*, 1929, Guinea: Kindia (L).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *treis*, three; chaete, bristle. Lemma bifid with a dorsal awn.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Annual, caespitose. Culms geniculately ascending, 30–60 cm long, 3–6 -noded. Leaf-sheaths pilose. Ligule an eciliate membrane, 3 mm long. Leaf-blades involute, 7–25 cm long, 0.5–3 mm wide. Leaf-blade surface pubescent, hairy abaxially. Leaf-blade apex acuminate.

Inflorescence. Synflorescence compound, linear, 10–25 cm long.

Inflorescence comprising only a few spikelets, comprising 1 fertile spikelets, terminal and axillary, subtended by a spatheole, enclosed. Spatheole linear, 1.5–3 cm long, scarious. Spikelets in threes. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 2 in the cluster. Pedicels present, filiform, 1–1.5 mm long, ciliate, with red hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, subterete, 5.5–7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus cuneate, 1.5 mm long, pubescent, base pungent, attached obliquely. Spikelet callus hairs red.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, coriaceous, dark brown, without keels, 6–7 -veined. Lower glume lateral veins obscure. Lower glume apex dentate, 2 -fid, awned, 2 -awned, awn 3–5 mm long. Upper glume oblong, without keels, 1 -veined. Upper glume lateral veins absent. Upper glume apex entire, awned, 1 -awned, awn 7–8 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3 mm long, hyaline, 0 -veined, without midvein, without lateral veins, ciliate on margins. Fertile lemma linear, 3–3.5 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 20–30 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3, 1.5–2 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Guinea, Sierre Leone.

Anadelphia trispiculata Stapf. Prain, *Fl. Trop. Afr.* 9: 398 (1919).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Guinea. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Guinea, Baffing valley: *Pobeguïn 1787* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *tria*, three, spicula, small-spike; -ata, possessing. The upper glume of the sessile spikelet is three-dentate.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Anthistiriinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 100–120 cm long. Ligule a ciliate membrane. Leaf-blades 10–20 cm long, 2–5 mm wide. Leaf-blade margins ciliate.

Inflorescence. Synflorescence compound, linear, 20–40 cm long.

Inflorescence comprising only a few spikelets, comprising 1 fertile spikelets, terminal and axillary, subtended by a spatheole, enclosed. Spatheole linear, 2–3 cm long, scarious. Peduncle 1.2 cm long. Spikelets in threes. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 2 in the cluster. Pedicels present, filiform, 5 mm long, ciliate, with dark brown hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, linear, 8–10 mm long, as long as fertile, separately deciduous. Companion sterile spikelet callus oblong, 1 mm long, 2-toothed or emarginate. Companion sterile spikelet glumes chartaceous, 11–13 -veined, glabrous, setaceously acuminate, muticous. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear or oblong, dorsally compressed, 8–10 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus linear, 3–3.5 mm long, bearded, base pungent, attached obliquely. Spikelet callus hairs dark brown.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume oblong, 1 length of spikelet, coriaceous, dark brown, without keels, 7 -veined. Lower glume lateral veins obscure. Lower glume surface pubescent, hairy below. Lower glume apex entire, truncate or obtuse. Upper glume oblong, coriaceous, without keels, 3 -veined. Upper glume margins ciliate. Upper glume apex dentate, 3 -fid, muticous or awned, 1 -awned, awn 2–5 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined, ciliate on margins. Fertile lemma linear, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 35–70 mm long overall, with twisted column. Column of lemma awn 22–45 mm long, glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3, 3.5–4 mm long. Caryopsis 4 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Ghana, Guinea, Ivory Coast, Liberia, Mali, Nigeria, Sierre Leone.

Anatherostipa bomanii (Hauman) P. Penailillo B. *Gayana, Bot.*, 53(2): 279 (1996).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. **Basionym or Replaced Name:** *Stipa bomanii* Hauman *An. Mus. Nac. Buenos Aires*, 29: 397 (1917). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E. Boman s.n.*, 2 Jun 1903, Argentina: Prov. Jujuy: Dep. Susques: Susque, 3700 m alt. (?; IT: BAA-2977).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (378).

Derivation (Clifford & Bostock 2007): in honor of E. Bowman (fl.1903) who collected in Argentina.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 20–40 cm long. Leaf-sheaths 7–10 cm long. Ligule an eciliate membrane, 4–6 mm long. Leaf-blades filiform, convolute, 10–17 cm long, 0.5 mm wide. Leaf-blade surface ribbed.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 15–20 cm long, 0.2–0.3 cm wide, bearing few spikelets. Primary panicle branches 2–4 -nate, 4–6 cm long. Panicle axis 4–5 noded. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4 mm long, 0.9 length of upper glume, membranous, without keels. Lower glume apex

acute. Upper glume lanceolate, 4.5 mm long, membranous, without keels, 3 -veined. Upper glume apex acute.

Florets. Fertile lemma lanceolate, subterete, 3 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn flexuous, 45–60 mm long overall. Palea without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Southern South America. Bolivia. Argentina Northwest, Chile North.

Jujuy. Tarapaca, Antofagasta.

Anatherostipa brevis (Torres) Peqailillo. *Contr. U.S. Natl. Herb.* 48: 109. 2003.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. **Basionym or Replaced Name:** *Nicoraella brevis* Torres, *Monogr. Comis. Invest. Ci. Prov. Buenos Aires*, 13: 73 (1997). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Prov. Jujuy: Dept. Tilcara: Falda Grande, Cerro de Guarahuasi, 3400 m, 4 Mar 1961, A. L. Cabrera & P. Hernandez 14047 (HT: BAA. IT: LP).

Stipa saltensis Kuntze, *Rev. Gen. Pl.* 3(2): 372 (1898).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (379).

Derivation (Clifford & Bostock 2007): L. short. Culms short.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations extravaginal or intravaginal. Culms erect, 10–20 cm long. Culm-nodes pubescent. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface or puberulous. Ligule an eciliate membrane, obtuse. Collar glabrous. Leaf-blades straight or curved, filiform, convolute, 2–8 cm long, 0.3–0.4 mm wide. Leaf-blade surface scaberulous, rough abaxially, puberulous, hairy adaxially.

Inflorescence. Inflorescence a panicle, comprising 8–15 fertile spikelets. Panicle contracted, linear, 3–5 cm long, bearing few spikelets. Panicle axis pilose. Panicle branches pilose. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, ciliate.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 3.5–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, 0.5 mm long, pubescent, hairy in a ring below, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 3.5–5 mm long, 1 length of upper glume, membranous, without keels, 1–3 -veined. Lower glume lateral veins absent or obscure. Lower glume apex acuminate. Upper glume lanceolate, 3.5–5 mm long, membranous, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 2.5–3.5 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, with conspicuous apical hairs. Lemma margins convolute, covering most of palea. Lemma hairs 1–1.5 mm long. Lemma apex awned, 1 -awned. Principal lemma awn curved, 9–14 mm long overall, persistent. Palea 2–2.5 mm long. Palea surface pubescent, hairy on back.

Flower and Fruit. Lodicules 2. Caryopsis with adherent pericarp, ellipsoid, 1.8 mm long. Hilum linear, 0.66 length of caryopsis.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northwest.

Jujuy.

Anatherostipa coroi F. Rojas. *Gayana, Bot.*54(2): 170–171, f. 2. 1997.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Bolivia. **Basionym or Replaced Name:** *Stipa coroi* FORSAN. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Depto: Cochabamba: Prov. Quillacollo, Cuenca Taquiqa, 3500 m, 3 Mar 1993, *Aleman & Fernandez 2471* (HT: LPB; IT: HRF-HRG-La Violeta).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): In honor of M. coroi (fl. 1982) Bolivian ecologist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–60 cm long. Lateral branches lacking. Ligule an eciliate membrane. Leaf-blades filiform, involute, 3–25 cm long, 1 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 7–20 cm long. Primary panicle branches appressed, whorled at most nodes. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5.3–7.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous or sparsely hairy, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5.3–7.5 mm long, 1 length of upper glume, hyaline, without keels. Lower glume apex acuminate. Upper glume lanceolate, 5.3–7.5 mm long, hyaline, without keels. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 3–4.5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn flexuous, 40–80 mm long overall. Palea without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp, fusiform. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

Anatherostipa hans-meyeri (Pilg.) Peqailillo. *Gayana, Bot.* 53(2): 279. 1996.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ecuador. **Basionym or Replaced Name:** *Stipa hans-meyeri* Pilg., *Engl. Jahrb.*56.*Beibl.* 123, 24, (1921). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Hans Meyer 139*, Jun 1903, Ecuador: Chimborazo: paramo region, 4500 m (B; ILT: US-866110 (fragm.)). LT designated by Hitchcock, *Contr. U.S. Natl. Herb.* 24(7): 272 (1925).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (76, Fig. 15 as *Stipa*).

Derivation (Clifford & Bostock 2007): in honor of Hans Meyer (fl. 1907) who collected in Ecuador.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 20–35 cm long, 0.5 mm diam. Culm-internodes distally glabrous. Culm-nodes glabrous. Leaves 2–4 per branch. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 3–4 mm long. Leaf-blades involute, 1 mm wide, stiff. Leaf-blade surface ribbed, scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Peduncle pubescent above, cylindrical at apex or tipped by a glumaceous appendage. Panicle open, linear, 3–10 cm long, bearing few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–9.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.3–0.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–9.5 mm long, 1 length of upper glume, hyaline, without keels, 1–3 -veined. Lower glume lateral veins absent or obscure. Lower glume apex acuminate. Upper glume lanceolate, 7–9.5 mm

long, 2–3 length of adjacent fertile lemma, hyaline, without keels, 1–3 -veined. Upper glume lateral veins absent or obscure. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, subterete, 3.5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma midvein pubescent. Lemma lateral veins obscure. Lemma surface glabrous, with conspicuous apical hairs. Lemma margins convolute, covering most of palea, pubescent. Lemma hairs 2.4–4 mm long. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 9–12 mm long overall, with twisted column. Column of lemma awn glabrous. Palea oblong, chartaceous, 2 -veined, without keels.

Flower and Fruit. Lodicules 2. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica, Western South America. Costa Rica. Bolivia, Ecuador, Peru.

Anatherostipa henrardiana (Parodi) Peqailillo. *Gayana, Bot.* 53(2): 279. 1996.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. **Basionym or Replaced Name:** *Stipa henrardiana* L. Parodi, *Blumea*, Suppl. 3, 68 (1946). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *A.L. Cabrera 9105*, 13 Feb 1946, Argentina: Jujuy: Dept. Susques: Cerro Tuzgle, 4900 m (BAA-3069; IT: LIL, LP, US-1962698).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (373).

Illustrations (Journals): *Blumea* (*Blumea Supp.*3: 68 (1946)).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Jan Theodor Henrard (1881–1974) Dutch botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short. Culms erect, 15–20 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 5–7 mm long, acuminate. Leaf-blades filiform, involute, 5–10 cm long, 0.3–0.4 mm wide. Leaf-blade surface ribbed. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle, comprising 8–15 fertile spikelets. Panicle open, 3–5 cm long, bearing few spikelets. Primary panicle branches 2 -nate, bearing 1–3 fertile spikelets on each lower branch. Panicle axis pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, purple, without keels, 3 -veined. Lower glume apex acute. Upper glume lanceolate, 5.5 mm long, membranous, purple, without keels, 3 -veined. Upper glume apex acute, mucronate.

Florets. Fertile lemma lanceolate, subterete, 4 mm long, chartaceous, grey, without keel, 5 -veined, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma hairs 1–1.5 mm long. Lemma apex awned, 1 -awned. Principal lemma awn curved, 3–3.5 mm long overall, deciduous, limb puberulous, glabrescent towards tip. Palea 1 length of lemma, 2 -veined, without keels. Palea surface pilose.

Flower and Fruit. Anthers 3, 1.5–2 mm long, anther tip smooth. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northwest.

Jujuy.

Recent Synonyms: *Stipa mucronata* H. B. & K., *Nov. Gen. et Sp.* 1: 125 (1815).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (380).

Derivation (Clifford & Bostock 2007): *L. mucro*, sharp point; *-ata*, possessing. With glumes or lemmas contracted into a short hard point or bifid and shortly awned from between the teeth.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Culms erect or geniculately ascending, 60–100 cm long. Culm-nodes pubescent. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 0.5–1 mm long. Leaf-blades flat or involute, 10–20 cm long, 1–3 mm wide. Leaf-blade surface pubescent, sparsely hairy, hairy on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, linear, dense, nodding, 10–30 cm long. Primary panicle branches appressed or ascending, 1–2 -nate. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2 mm long, pubescent (tawny), acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume oblong, 1 length of upper glume, membranous, purple, without keels, 3 -veined. Lower glume primary vein scabrous. Lower glume apex acuminate. Upper glume oblong, 25–40 mm long, membranous, purple, without keels, 5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma oblong, subterete, 5–6 mm long, 1 mm wide, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface papillose, rough above, pubescent, hairy below. Lemma margins convolute, covering most of palea. Lemma apex with a short cylindrical neck or surmounted by a ring of hairs, with this appendage 0.5 mm long, awned, 1 -awned. Principal lemma awn bigeniculate, 35–50 mm long overall, with twisted column. Middle segment of lemma awn 8–9 mm long. Column of lemma awn 10 mm long, hispidulous. Palea 2 -veined, without keels.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica, Northern South America, Western South America, Southern South America. Bolivia. Argentina Northwest, Chile North.

Catamarca, Jujuy, Salta, Tucuman. Tarapaca, Antofagasta, Atacama.

Derivation (Clifford & Bostock 2007): *L. blunt*. Glumes or lemmas apically rounded.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 30–60 cm long. Ligule an eciliate membrane, 3–7 mm long. Leaf-blades filiform, 10–25 cm long, 0.5–1 mm wide, stiff. Leaf-blade surface ribbed, scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, interrupted, 8–15 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pubescent, obtuse.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, purple, without keels. Lower glume apex obtuse. Upper glume lanceolate, 2.5–3 mm long, membranous, purple, without keels. Upper glume apex obtuse.

Florets. Fertile lemma lanceolate, subterete, 2.5–2.8 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn straight or flexuous, 8–10 mm long overall. Palea 1 length of lemma, 2 -veined, without keels.

Flower and Fruit. Anthers 3, 1 mm long, anther tip smooth. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Southern South America. Bolivia, Peru. Argentina Northwest.

Anatherostipa orurensis F. Rojas. *Gayana, Bot.* 54(2): 171–172, f. 3. 1997.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Bolivia. **Basionym or Replaced Name:** *Stipa orurensis* (Rojas) FORSAN. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *Peterson 12742*, 7 Mar 1993, Bolivia, Dpto. Oruro, Prov. S. Pagador. ca 20 mi SSE of Huari, 2 mi W of Urmiri, 3620 m (LPB; IT: US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Oruro Department, Bolivia.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–60 cm long. Lateral branches lacking. Ligule an eciliate membrane. Leaf-blades aciculate, convolute, 15–30 cm long, 1–1.5 mm wide. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle open, oblong, loose, 5–15 cm long, bearing few spikelets. Panicle branches flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–7.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate or ovate, 6–7.5 mm long, 1 length of upper glume, hyaline, without keels. Lower glume apex acuminate. Upper glume lanceolate or ovate, 6–7.5 mm long, hyaline, without keels. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, gibbous, 4.2–4.6 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma apex attenuate, awned, 1 -awned. Principal lemma awn straight, 3–5(–7) mm long overall, deciduous. Palea without keels.

Flower and Fruit. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp, fusiform. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

Anatherostipa rigidiseta (Pilg.) P. Penailillo. *Gayana, Bot.*, 53(2): 279 (1996).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Peru. **Basionym or Replaced Name:** *Oryzopsis rigidiseta* Pilg., *Engl. Jahrb.* 56. *Beibl.* 123, 26 (1920). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: A. Weberbauer 475, Feb 1902, Peru: Puno: Azangaro, 4000 m (B; IT: BAA-1767 (fragm. ex B), US-81976, US-1645161).

Recent Synonyms: *Stipa rigidiseta* (Pilg.) Hitchcock, *Contrib. U. S. Nat. Herb.* 24: 285 (1925).

Illustrations (Journals): *Ruizia* (13:70, Fig 81-m (1993) as *Stipa*).

Derivation (Clifford & Bostock 2007): *L. rigidus*, stiff; seta, bristle. Lemma awn rigid.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–50 cm long. Ligule an eciliate membrane, 4 mm long. Leaf-blades filiform, convolute, 25–45 cm long, 0.5 mm wide. Leaf-blade surface ribbed, scabrous, glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 6–15 cm long. Panicle axis with lower internodes 2–4 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 0.5–4 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, 0.3 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, reaching apex of florets or exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 3.2 mm long, 0.8 length of upper glume, membranous, without keels, 3–5 -veined. Lower glume apex acuminate. Upper glume lanceolate, 4 mm long, membranous, without keels, 3–5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 3–4 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy all along. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn straight, 6–10 mm long overall, limb puberulous. Palea 2.5–2.9 mm long, 1 length of lemma, without keels.

Flower and Fruit. Lodicules 3, 0.6 mm long. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Southern South America. Bolivia, Peru. Chile North.

Tarapaca, Antofagasta, Atacama.

Anatherostipa rosea (Hitchc.) Peqailillo. *Contr. U.S. Natl. Herb.* 48: 110. 2003.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ecuador. **Basionym or Replaced Name:** *Stipa rosea* Hitchc., *Contrib. U. S. Nat. Herb.* 24: 272 (1925). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *Hitchcock 21523*, 7 Sep 1923, Ecuador: Loja: 2200–3100 m (US-1197850; IT: S (fragm.)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. rosea*, pink.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–60 cm long. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 3–4 mm long. Leaf-blades involute, 12–20 cm long, 1 mm wide. Leaf-blade surface ribbed, glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 12–20 cm long. Primary panicle branches ascending. Panicle branches terete, smooth, with scattered hairs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, 0.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, red, without keels. Lower glume lateral veins obscure. Lower glume apex acuminate. Upper glume lanceolate, 7 mm long, membranous, red, without keels. Upper glume primary vein obscure. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 3 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma midvein ciliate. Lemma surface with conspicuous apical hairs. Lemma margins convolute, covering most of palea. Lemma hairs 3 mm long. Lemma apex awned, 1 -awned. Principal lemma awn flexuous or bigeniculate, 10 mm long overall, with a straight or slightly twisted column. Palea without keels.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Ecuador, Peru.

Anatherostipa venusta (Phil.) P. Penailillo B. *Gayana, Bot.*, 53(2): 279 (1996).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. **Basionym or Replaced Name:** *Stipa venusta* Phil., *Anal. Mus. nac. Chile* 81. (1891). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *F. Philippi 105*, Chile: Tarapaca (SGO-PHIL-151; IT: BAA (fragm.), SGO-37389, SGO-63171, US-81901 (fragm. ex SGO), US-81902 (fragm. ex W), US-825162 (fragm.), US- (photo SGO-37389)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. beautiful, graceful. Mostly a reference to habit.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 15–30 cm long. Ligule an eciliate membrane, 3–4 mm long. Leaf-blades filiform, convolute, 10–15 cm long, 0.3–0.4 mm wide. Leaf-blade surface ribbed, glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 5–20 cm long. Panicle axis with lower internodes 1–4 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–3 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, 0.3 mm long, pubescent, hairy in a ring above, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 3.5 mm long, 0.9 length of upper glume, membranous, purple, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 4 mm long, membranous, purple, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 3 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface glabrous. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, pubescent, awned, 1 -awned. Principal lemma awn flexuous, 45–65 mm long overall, with twisted column. Palea 2.5 mm long, 1 length of lemma, without keels.

Flower and Fruit. Lodicules 3, 0.6 mm long. Anthers 3, 1–1.2 mm long. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform, 2 mm long. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Chile North. Tarapaca, Antofagasta, Atacama, Coquimbo. Tarapaca, Antofagasta.

Ancistrachne ancylotricha (Quisumb. & Merrill) S. T. Blake. *Univ. Queensl. Papers, Dept. Biol.*, 1, No. 19, 6 (1941).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, J.F.Veldkamp, Poaceae ms (*Flora Malesiana*).

TYPE from Philippines. **Basionym or Replaced Name:** *Panicum ancylotrichum* Quisumb. & Merr., *Philipp. Journ. Sc.* 37: 135. (1928). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: "Mindanao, Davao Province, Mati Bur. Sci. 49069 Hamos and Edaqa, April 9, 1927 along Dawan River, in thickets and forests and in the open, at low altitudes.",.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *agkylos*, curved; thrix, hair.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Neurachninae.

Habit, Vegetative Morphology. Perennial. Culms rambling, 100–150 cm long, 2.5–3 mm diam., wiry. Culm-internodes distally glabrous. Lateral branches sparse. Leaf-sheaths smooth, glabrous on surface, inner surface glabrous. Ligule a fringe of hairs. Leaf-blade base broadly rounded. Leaf-blades reflexed, deciduous at the ligule, 1–13.5 cm long, 2.5–7 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 7.5–17.5 cm long. Primary panicle branches ascending, simple, 2–4 cm long. Panicle axis glabrous. Spikelets in pairs. Fertile spikelets sessile and pedicelled. Pedicels present, 2–4 mm long, scaberulous.

Fertile Spikelets. Spikelets without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, tilted on the pedicel, dorsally compressed, 3.75 mm long, falling entire. Spikelet callus attached transversely.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5–0.6 length of spikelet, chartaceous, without keels, 3 -veined. Lower glume surface pilose, hairy above, with tubercle-based hairs or hooked hairs. Lower glume apex acute. Upper glume ovate, 1 length of spikelet, with hyaline margins, without keels, 9 -veined. Upper glume surface pilose, with tubercle-based hairs or hooked hairs. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, coriaceous, much thinner on margins, 7–9 -veined, pilose, with tubercle-based hairs or hooked hairs, obtuse. Fertile lemma elliptic, 3.5 mm long, cartilaginous, much thinner on margins, without keel. Lemma surface punctate. Lemma margins flat. Lemma apex acute, laterally pinched.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Malesia. Philippines.

Ancistrachne maidenii (A. A. Hamilton) Vickery. *Contrib. N. S. Wales Nat. Herb.* 3: 83 (1961).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Eriochloa maidenii* A.A. Ham., *Proc. Linn. Soc. N. S. Wales*, 37: 709 (1913). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: New South Wales: Hawkesbury River, 3–5–1912, *Hamilton s.n.* (HT: NSW-52514)

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler,, *Grasses of New South Wales*, 4th edn (2008) (121).

Derivation (Clifford & Bostock 2007): in honor of Joseph Henry Maiden (1859–1925) English-born Australian botanist.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Neurachninae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, 30–100 cm long, wiry, 8–20 -noded. Culm-nodes glabrous. Ligule a fringe of hairs, 0.4–0.6 mm long. Leaf-blades linear or lanceolate, flat or involute, 1–4 cm long, 1–4 mm wide. Leaf-blade margins cartilaginous, scabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, paucilateral, 3–10 cm long. Spikelet packing abaxial. Spikelets solitary or in pairs. Fertile spikelets pedicelled, 1–2 in the cluster. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the

lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, obtuse, 2.5–3 mm long, falling entire. Spikelet callus attached transversely.

Glumes. Glumes one the lower absent or obscure or two, dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume oblong, clasping, 0–0.25 mm long, 0–0.1 length of spikelet, hyaline, without keels, 0–3 -veined. Lower glume surface glabrous or pubescent. Lower glume apex acute. Upper glume lanceolate, 2.5–3 mm long, 1 length of spikelet, scarious, without keels, 5 -veined. Upper glume lateral veins ribbed. Upper glume surface hispidulous, with tubercle-based hairs (curved). Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, lanceolate, 1 length of spikelet, membranous, 7–9 -veined, ribbed, hispidulous, with tubercle-based hairs (curved), acute. Fertile lemma elliptic, 2.2–2.7 mm long, coriaceous, without keel. Lemma margins flat. Lemma apex acute, mucronate. Palea coriaceous.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales.

Ancistrachne numaeensis (Balansa) S.T. Blake. *Proc. Roy. Soc. Queensland* 81: 1. 1969.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), W.D.Clayton & N.Snow, *Key to Pacific Grasses* (2010).

TYPE from New Caledonia. **Basionym or Replaced Name:** *Panicum numaeense* Balansa, *Bull. Soc. Bot. Fr.* 19 :325. (1872). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: "Presqu'île de Noumea, dans les bosquets ...", *Balansa 1736; Pancher*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Noumea, New Caledonia.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Neurachninae.

Habit, Vegetative Morphology. Perennial. Culms rambling, 50–100 cm long, wiry. Lateral branches ample. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades 3–13 cm long, 2–8 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 1–6 cm long. Primary panicle branches appressed, indistinct the panicle almost racemose, 0.2–1 cm long, bearing 1–3 fertile spikelets on each lower branch. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1 mm long, tip cupuliform.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, tilted on the pedicel, dorsally compressed, compressed slightly, 3 mm long, falling entire. Spikelet callus attached transversely.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5–1 mm long, 0.15–0.33 length of spikelet, membranous, without keels, 0 -veined. Lower glume lateral veins absent. Lower glume surface puberulous. Lower glume apex acute. Upper glume oblong, 1 length of spikelet, chartaceous, without keels, 7–9 -veined. Upper glume lateral veins ribbed. Upper glume surface pilose, with hooked hairs. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, with palea. Lemma of lower sterile floret similar to upper glume, oblong, 1 length of spikelet, chartaceous, 7 -veined, ribbed, pilose, with hooked hairs, acute. Fertile lemma oblong, 3 mm long, coriaceous, without keel. Lemma margins flat. Lemma apex acute, pubescent. Palea coriaceous.

Distribution (TDWG). Continent. Pacific.

Country /Province /State. Southwestern Pacific. New Caledonia.

TYPE from Australia. **Basionym or Replaced Name:** *Panicum uncinulatum* R. Br., *Prodromus Florae Novae Hollandiae* 191. 1810. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: Brown.

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (121), J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (96),

T.D.Stanley & E.Ross, *Flora of South East Queensland, Gramineae* (1989) (205, Fig. 32), D.Sharp & B.K.Simon, *AusGrass. Grasses of Australia. CD-Rom Version 1.0.* (2002).

Illustrations (Journals): *Univ. Queensland Dept. Biol. Pap.* (1(19); 12, Pl.2 (1941)).

Derivation (Clifford & Bostock 2007): *L. uncinulus*, small hook; -ata, possessing. With hooked hairs on the glumes and sterile lemma.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Neurachninae.

Habit, Vegetative Morphology. Perennial. Culms 150–200 cm long, wiry. Ligule a fringe of hairs. Leaf-blade base broadly rounded. Leaf-blades reflexed, deciduous at the ligule, 1–6 cm long, 1.5–4 mm wide. Leaf-blade surface pilose, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, oblong or pyramidal, 2–14 cm long. Primary panicle branches simple, 2–3.5 cm long, bearing 1–8 fertile spikelets on each lower branch. Panicle branches angular, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, 0.8–2.7 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, tilted on the pedicel, dorsally compressed, 4.3–5 mm long, falling entire. Spikelet callus attached transversely.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 1–2.5 mm long, 0.25–0.5 length of spikelet, chartaceous, without keels, 3–5 -veined. Lower glume apex obtuse. Upper glume ovate, chartaceous, with hyaline margins, without keels, 9–11 -veined. Upper glume surface pilose, with hooked hairs. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, coriaceous, much thinner on margins, 7–9 -veined, pilose, with hooked hairs, obtuse. Fertile lemma orbicular, 3.5–4 mm long, coriaceous, much thinner on margins, without keel, 5–7 -veined, more than 3-veined. Lemma margins flat. Lemma apex acute, laterally pinched. Palea coriaceous.

Distribution (TDWG). Continent. Australasia, Pacific.

Country /Province /State. Australia. New South Wales, Queensland. **Southwestern Pacific.** Fiji.

Ancistragrostis uncinoides S. T. Blake. *Blumea, Suppl.* 3, 56 (1946).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*) (as *Deyeuxia*).

TYPE from Papua New Guinea. **Basionym or Replaced Name:** *Deyeuxia uncinoides* (S.T. Blake) P. van Royen & J.F.Veldkamp, P. van Royen, *Alp. Fl. New Guinea*, 2: 1140 (1979). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: New Guinea, Mt. Victoria: *McGregor*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Resembling *Uncinia* because of its hooked lemma.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 6–10 cm long, 2 -noded. Ligule an eciliate membrane, 1.1–1.5 mm long, lacerate. Leaf-blades filiform, convolute, 3–5 cm long, 0.8–1.3 mm wide. Leaf-blade surface scaberulous, rough abaxially. Leaf-blade apex obtuse.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 2.5–3 cm long, 0.4–0.5 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 0.5–1.8 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2.8–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma, gaping. Lower glume ovate, 1.9–2.1 mm long, 0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume ovate, 2–2.3 mm long, 0.75 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma ovate, 2.8–3 mm long, cartilaginous, keeled, 5 -veined, more than 3-veined. Lemma apex emarginate, awned, 1 -awned. Principal lemma awn subapical, hooked, 0.7–1.2 mm long overall. Palea 0.6 length of lemma. Rhachilla extension 0.2 length of fertile floret, pilose, with 0.5–0.7 mm long hairs.

Flower and Fruit. Anthers 3, 0.7–1.2 mm long.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Papuaasia. New Guinea PNG, or West Papua (Irian Jaya). New Guinea.

Andropogon abyssinicus R. Br. ex Fresen. *Mus. Senkenb.* 2: 146. (1837).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ethiopia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Abyssinia: Simen, *Rueppell s.n.* (HT: FR).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (323, Fig. 130).

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Abyssinia, now Ethiopia.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Butt sheaths glabrous. Culms geniculately ascending, 10–80 cm long. Ligule an eciliate membrane. Leaf-blades 5–25 cm long, 2–7 mm wide. Leaf-blade midrib evident.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes 2, paired, 1–15 cm long. Rhachis fragile at the nodes, ciliate on margins or villous on margins. Rhachis hairs white. Rhachis internodes linear. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, ciliate or villous, with white hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate or ovate, dorsally compressed, 4–9 mm long, shorter than fertile, persistent. Companion sterile spikelet glumes chartaceous, wingless or winged on keels, acute, awned, both glumes awned, with 2–8 mm long awn. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate or ovate, dorsally compressed, 5–11 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus oblong, 1–3 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate or ovate, 1 length of spikelet, chartaceous or coriaceous, 2-keeled, keeled laterally, wingless or winged on keel. Lower glume intercarinal veins distinct, 7 in number. Lower glume surface convex or flat or concave, glabrous to villous. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume awned, 1 -awned, awn 3–9 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–25 mm long overall, with twisted column. Column of lemma awn glabrous. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. *n* = 16 (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa, East Tropical Africa, South Tropical Africa. Eritrea, Ethiopia (inc. Eritrea). Kenya, Tanzania, Uganda. Angola.

Andropogon aequatoriensis Hitchcock. *Contrib. U. S. Nat. Herb.* 24: 499 (1927).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Collected on grassy slopes, between Loja and San Lucas, Ecuador alt. about 2500 meters, Sept. 6, 1923, A.S. *Hitchcock 21481* (HT: US-1163457; IT: S (fragm.)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *aequator*, equator; -ensis, denoting origin. Growing near the equator in Ecuador.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 100 cm long. Lateral branches ample. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1–2 mm long, truncate. Leaf-blades 15–30 cm long, 3–8 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous.

Inflorescence. Synflorescence compound, linear.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Peduncle 5–10 cm long, glabrous. Racemes 2–3, paired or digitate, 2–3 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis internodes linear, 3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 3.5 mm long, villous.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, 1 mm long, shorter than fertile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume primary vein scabrous. Lower glume surface concave. Upper glume linear, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 6 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia, Ecuador.

Andropogon africanus Franch. *Bull. Soc. hist. nat. Autun*, 8: 325. (1895).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Congo. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Congo Francais: Sables humides dans la plaine de Mpila, pres de Brazzaville, *Brazza & Thollon* 55

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating location. From Africa.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–250 cm long. Ligule a ciliate membrane. Leaf-blades flat or conduplicate, 10–40 cm long, 2–7 mm wide. Leaf-blade apex abruptly acute.

Inflorescence. Synflorescence compound, paniculate, open.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 7–10 cm long. Racemes 2, paired, sinuous, 3–4 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 1–2 mm long. Spikelet packing lax. Rhachis internodes filiform. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets ascending, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, curved, ciliate, with 1–2 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 4–7 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute, awned, one glume awned, with 6 mm long awn. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, dorsally compressed, 4–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, membranous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 5 mm long, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.33–0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 5–25 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. $n = 20$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa. Burkina, Ghana, Guinea, Ivory Coast, Mali, Mauritania, Senegal, Sierra Leone, Niger. Central African Republic, Congo, DRC. Sudan. Kenya, Tanzania. Angola, Zambia, Zimbabwe.

Andropogon alopecurus (Desv.) Hack. DC. *Monog. Phan.* 6: 381. (1889).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Reunion. **Basionym or Replaced Name:** *Heterochloa alopecurus* Desv., *Opusc.* 66 (1831). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: *Crescit in insula Borboniae.*

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *alopez*, fox; *oura*, tail. The spicate inflorescence resembling a fox tail.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms rambling, slender, 30–40 cm long. Lateral branches sparse. Ligule an eciliate membrane, 2–3 mm long, obtuse. Leaf-blades 10–20 cm long, 1.5–2 mm wide. Leaf-blade surface glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, 4–6.5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs on 2 margins. Rhachis internodes clavate, 4 mm long. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets squeezed between internode and pedicel, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, 4 mm long, ciliate, hairy on margins.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas, linear, dorsally compressed, 3 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, laterally compressed, 5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally, keeled obtusely. Lower glume surface deeply depressed, glabrous. Upper glume linear, chartaceous, 1-keeled.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret hyaline. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 6–8 mm long overall, with twisted column. Column of lemma awn puberulous. Palea absent or minute.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Mauritius, Madagascar, Reunion.

Andropogon amethystinus Steud. *Syn. Pl. Gram.* 371. (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960) (as *A. longipes*).

TYPE from Ethiopia. **Basionym or Replaced Name:** *Andropogon pratensis* Hochst. ex Hack., DC. *Monog. Phan.* 6 : 463. (1889), *A. longipes* Hack., *Flora*, 58: 138. (1885). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Schimper* 88, Ethiopia (P).

Illustrations (Books): H.Jacques-Felix, *Les Graminees d'Afrique tropicale* (1962) (299, Fig. 237 as *A. pratensis*), S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (323, Fig. 130).

Derivation (Clifford & Bostock 2007): *L. amethysteus*, violet; *-ina*, belonging to. Spikelets dark purplish-red.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, culms solitary or caespitose. Rhizomes absent or elongated. Butt sheaths glabrous. Culms geniculately ascending or decumbent, 8–60 cm long. Ligule an eciliate membrane. Leaf-blades flat or convolute, 1–15 cm long, 1–4 mm wide. Leaf-blade midrib evident.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes 2, paired, 2–8 cm long. Rhachis fragile at the nodes, ciliate on margins or villous on margins. Rhachis hairs white. Rhachis internodes linear. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear or clavate, ciliate or villous, with white hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate or ovate, dorsally compressed, 4–8 mm long, as long as fertile, persistent. Companion sterile spikelet glumes chartaceous, wingless or winged on keels, acute, awned, one glume awned, with 1–3 mm long awn. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate or elliptic, dorsally compressed, 5–8.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus cuneate, 1 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate or elliptic, 1 length of spikelet, chartaceous or coriaceous, 2-keeled, keeled laterally, wingless or winged on keel. Lower glume intercarinal veins distinct, 2–6 in number. Lower glume surface convex or flat or concave, glabrous to villous. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume awned, 1 -awned, awn 2–6 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–15 mm long overall, with twisted column. Column of lemma awn glabrous. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. $n = 30$ (ca), or 40 (2 refs TROPICOS). $2n = 20$ (1 ref TROPICOS as *A. longipes*).

Distribution (TDWG). Continent. Africa, Temperate Asia, Tropical Asia.

Andropogon andringitrense (A. Camus) Voronts. *Kew Bull.* 68: 2 (2013).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. **Basionym or Replaced Name:** *Dichanthium andringitrense* A. Camus, *Bull. Soc. Bot. France* 71: 921 (1924 publ. 1925). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madagascar, Andringitra: *Perrier 13719*.

Illustrations: None found.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms erect, 30–55 cm long. Culm-internodes distally glabrous. Culm-nodes bearded. Lateral branches ample. Leaf-sheaths striately veined. Ligule a ciliate membrane. Leaf-blades 4–16 cm long, 2–4 mm wide, stiff. Leaf-blade surface glabrous, hairless except near base. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 2–3, paired or digitate, 6–7 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes filiform, 0.33 length of fertile spikelet. Raceme-bases filiform, 2–5 mm long, hirsute. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster.

Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 3 mm long, without a translucent median line, ciliate.

Sterile Spikelets. Basal sterile spikelets well-developed, 6–8 in number (lower raceme), male, smaller than fertile. Basal sterile spikelet lemmas awnless.

Companion sterile spikelets well-developed, male, lanceolate, 6.5 mm long, as long as fertile, separately deciduous. Companion sterile spikelet glumes winged on keels, 11 -veined. Companion sterile spikelet lemmas enclosed by glumes, mucicous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 6.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 6.5 mm long, 1 length of spikelet, chartaceous, without keels, keel-less except near apex, winged on keel, winged narrowly, 14–18 -veined. Lower glume surface glabrous. Lower glume apex attenuate. Upper glume lanceolate, 5.5 mm long, 1-keeled. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 2–2.5 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma linear, hyaline, without keel, 0–3 -veined. Lemma margins ciliate. Lemma apex lobed, 2 -fid, incised 0.66 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 12 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Caryopsis with adherent pericarp, oblong or ovoid.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Andropogon angustatus (Presl) Steud. *Syn.* 1: 370 (1854).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. **Basionym or Replaced Name:** *Diectomis angustata* J. Presl, *Rel. Haenk.* 1: 333 (1830). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Haenke s.n.*, 1791, Mexico (PR; IT: LE-TRIN-156.01, MO-1837467, MO-5117489 (line drawing), US-75547 (fragm.)).

Illustrations (Books): R.McVaugh, *Flora Nova-Galiciana* Vol.14 *Gramineae* (1983) (as *Diectomis laxa*), J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (21, Fig. 4), E.Judziewicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (54, Fig. 6).

Illustrations (Journals): *Revista Brasil. Bot.* (29: 296, Fig.1 (2006)).

Derivation (Clifford & Bostock 2007): *L. angusta*, narrow; *-ata*, possessing. Leaf-blades narrow.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 20–100 cm long, 1–1.5 mm diam. Culm-nodes glabrous. Lateral branches ample. Ligule an eciliate membrane, 1–2.5 mm long, brown. Leaf-blades flat or conduplicate, 15–30 cm long, 1.5–3 mm wide. Leaf-blade surface glabrous.

Inflorescence. Synflorescence compound, paniculate.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Racemes 2, paired, 2–4 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 0.5–1 mm long. Rhachis internodes cuneate, 2–2.5 mm long. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets squeezed between internode and pedicel, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, 2–2.5 mm long, ciliate, with 0.5–1 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate or elliptic, dorsally compressed, 5.5–6 mm long, longer than fertile. Companion sterile spikelet glumes chartaceous, glabrous, ciliate on margins, acute, awned, one glume awned, with 5–18 mm long awn. Companion sterile spikelet lemmas 1–2.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the

lower floret male or barren, the upper fertile. Spikelets linear, laterally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus 1 mm long, pubescent, base acute, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume intercarinal veins absent. Lower glume surface deeply depressed. Lower glume apex dentate, 2 -fid. Upper glume linear, membranous, 1-keeled, 3 -veined. Upper glume awned, 1 -awned, awn 10–15 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3–4.2 mm long, hyaline, 2 -veined, ciliate on margins. Fertile lemma lanceolate, 2.8–4 mm long, hyaline, without keel, 1 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 30–50 mm long overall, with twisted column. Column of lemma awn glabrous. Palea 1.5–2 mm long, 0 -veined.

Flower and Fruit. Anthers 3, 1.7–2.1 mm long.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Central Mexico, Southwest Mexico, Southeast Mexico. Mesoamerica, Caribbean, Northern South America, Western South America, Brazil. Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, Panama. Cuba. Guyana, Surinam, Venezuela. Bolivia, Colombia. Brazil West Central, Brazil North.

Andropogon appendiculatus Nees. Fl. Afr. Austr. 105. (1841).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online, U. Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: S. Africa.

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (500, Fig. 403).

Images: F. van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): stalked male spikelets subtended by a conspicuous appendage.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Basal innovations flabellate. Culms 30–130 cm long. Leaves mostly basal. Leaf-sheaths keeled. Ligule a ciliate membrane. Leaf-blades flat or conduplicate, 15–50 cm long, 3–6 mm wide.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes 4–20, digitate, (3–)6–15 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes clavate. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, clavate, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 5–7 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute, awned, one glume awned, with 1–2 mm long awn. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 5–7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, chartaceous, purple, 2-keeled, keeled dorsally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 5 mm long, hyaline, 2 -veined. Fertile lemma oblong, 1.5 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.33–0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–15 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

$n = 10$, or 20, or 30 (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa, Southern Africa. Zimbabwe. Limpopo, North-West, Gauteng, Mpumalanga, Swaziland, Free State, Kwazulu-Natal, Lesotho, Northern Cape, Western Cape, Eastern Cape.

Andropogon arctatus Chapm. Coult. *Bot. Gaz.* 3: 20. (1878).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Chapman s.n.*, USA: Florida (NY). LT designated by Campbell, J. *Arnold Arbor.* 64: 207 (1983).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (658).

Derivation (Clifford & Bostock 2007): *L. arcta*, narrow; -atus, possessing. Racemes of spikelets narrow.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 100–150 cm long. Lateral branches ample. Leaf-sheaths hirsute. Ligule an eciliate membrane. Leaf-blades erect, 15–30 cm long, 3–5 mm wide. Leaf-blade surface scabrous, rough adaxially, pubescent, hairy abaxially.

Inflorescence. Synflorescence compound, linear.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 3–5 cm long. Peduncle 3–5 cm long. Racemes 2, paired, 2.5–4 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis hairs 3 mm long. Rhachis internodes linear, 2–3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 3–4 mm long, villous, with 3 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, linear, 0.5–1.5 mm long, shorter than fertile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base obtuse, inserted. Spikelet callus hairs 0.33 length of spikelet.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume primary vein ciliate. Lower glume intercarinal veins absent. Lower glume surface deeply depressed. Upper glume lanceolate, membranous, 1-keeled. Upper glume primary vein ciliate. Upper glume margins ciliate. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 7–12 mm long overall, with a straight or slightly twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 1.

n = 10 (1 ref TROPICOS).

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA. Alabama, Florida.

Andropogon arenarius Hack. *Flora* 68: 134. (1885).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uruguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J. Arechavaleta* 204, no date, Uruguay: Montevideo (W; IT: US-75544 (fragm. ex W)).

Illustrations (Books): L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (1285, Fig. 251 & 254), B.Rosengurt, *Gramineas Uruguayas I* (1970) (160, Fig. 62).

Illustrations (Journals): *Revista Brasil. Bot.* (29: 296, Fig.2 (2006)).

Derivation (Clifford & Bostock 2007): *L. arena*, sandy place; *-aria*, pertaining to. Of sandy habitats.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations intravaginal. Culms 60–80 cm long. Culm-nodes glabrous. Leaf-sheaths 8–18 cm long, glabrous on surface. Ligule an eciliate membrane, 1–1.8 mm long, truncate. Leaf-blades 9–37 cm long, 2–3 mm wide, stiff. Leaf-blade surface glabrous.

Inflorescence. Synflorescence compound, paniculate.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole lanceolate, 6–8 cm long. Racemes 2–3, paired or digitate, 3–6 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis hairs 10–16 mm long. Rhachis internodes filiform, 0.66 length of fertile spikelet. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, villous, with 10–16 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas or male, lanceolate, 5–7 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 3.5–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel. Lemma apex dentate, 2-fid, awned, 1-awned. Principal lemma awn from a sinus, geniculate, 2–5.5 mm long overall, with a straight or slightly twisted column. Column of lemma awn 0.5–0.8 mm long, glabrous.

Flower and Fruit. Anthers 3, 0.8 mm long. Caryopsis 1.2–2.4 mm long, dark brown.
 $n = 30$ (1 ref TROPICOS).

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil South. Uruguay. Catarina, Rio Grande do Sul. Rio Grande do Sul, Santa Catarina.

Andropogon aridus W.D. Clayton. *Kew Bull.* 32(1): 1 (1977).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online, U. Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Somalia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Somalia, Hubera: *McKinnon S251* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L.* dry. Growing in arid places.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, cushion forming. Culms 20–25 cm long. Ligule an eciliate membrane. Leaf-blades filiform, terete, 3–5 cm long, 1 mm wide.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes 1–2, single or paired, 1–3 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 5 mm long. Rhachis internodes linear. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, ciliate, hairy all along but hairs longer above, with 5 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 5 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, acute, muticous. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 6–6.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus oblong, 1 mm long, bearded, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic, 1 length of spikelet, chartaceous, 2-keeled, keeled laterally, winged on keel, winged near apex. Lower glume intercarinal veins distinct, 4 in number. Lower glume surface convex, pilose, hairy below. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, chartaceous, 1-keeled. Upper glume apex acute, muticous.

Florets. Basal sterile florets 1, barren, with palea. Lemma of lower sterile floret lanceolate, 3 mm long, hyaline, 2 -veined. Palea of lower sterile floret 0.5 length of lemma. Fertile lemma lanceolate, 4.5 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15 mm long overall, with twisted column. Column of lemma awn glabrous. Palea 0.75 length of lemma.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Somalia.

Andropogon auriculatus Stapf. Prain, *Fl. Trop. Afr.* 9: 258 (1918).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cameroun, Nigeria. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Cameroun, Batanga: Bates 336 (K syn);.

Illustrations (Books): H.Jacques-Felix, *Les Graminees d'Afrique tropicale* (1962).

Derivation (Clifford & Bostock 2007): *L. auris*, ear; -*ula*, diminutive; -*ata*, possessing. Leaf-blades rounded at the base or with auricles.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations flabellate. Culms 100–150 cm long. Leaf-sheaths keeled. Leaf-sheath auricles erect, 4–10 mm long. Ligule an eciliate membrane, 4–10 mm long. Leaf-blade base tapering to the midrib. Leaf-blades 15–30 cm long, 4–8 mm wide. Leaf-blade surface glabrous or pubescent, hairy abaxially. Leaf-blade apex attenuate.

Inflorescence. Synflorescence compound, paniculate, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 6–10 cm long. Racemes 2, paired, 4–7 cm long. Rhachis fragile at the nodes, glabrous on surface or pubescent on surface, ciliate on margins. Rhachis internodes clavate, 3 mm long. Rhachis internode tip oblique, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, clavate, 3 mm long, ciliate, tip lobed (bilobed).

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas or male, oblong, dorsally compressed, 4 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, acute, awned, one glume awned. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 5.5–7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, chartaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins distinct. Lower glume surface flat or with a longitudinal median groove, pubescent, hairy in lines (along midline). Lower glume apex dentate, 2 -fid. Upper glume lanceolate, chartaceous, 1-keeled, 3 -veined. Upper glume surface glabrous or puberulous. Upper glume margins ciliate. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 5 mm long, hyaline, 3 -veined, ciliate on margins. Fertile lemma oblong, 4 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.25 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–17 mm long overall, with twisted column. Column of lemma awn glabrous. Palea oblong, 0.25 length of lemma, 0 -veined, without keels.

Flower and Fruit. Anthers 3, 3 mm long.
Distribution (TDWG). Continent. Africa.
Country /Province /State. West Tropical Africa, West-Central Tropical Africa. Gambia, Guinea-Bissau, Ivory Coast, Nigeria, Senegal, Sierre Leone.

Andropogon barretoi Norrmann, Quarin. *Darwiniana* 39(1–2): 171 (2001).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil, Santa Maria: Norrmann, Keeler & Barreto 146 (ICN holo, BAA, CORD, CITES, K, MBM, SI).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Ismar L. Barreto, Argentinian agronomist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations intravaginal. Culms erect, robust, 150–200 cm long. Culm-nodes glabrous. Lateral branches sparse. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1.5–3 mm long, truncate. Leaf-blade base tapering to the midrib. Leaf-blades 10–15 mm wide. Leaf-blade surface glabrous, hairless except near base. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Synflorescence compound, linear.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Racemes 5–16, digitate, 7–12 cm long, bearing 12–25 fertile spikelets on each. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 4–7 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, acute, muticous. Companion sterile spikelet lemmas muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear or lanceolate, dorsally compressed, 3.5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins distinct, 2 in number. Lower glume surface concave, asperulous, rough above. Upper glume lanceolate, coriaceous, 1-keeled.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel. Lemma margins ciliate. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, curved, 4–8 mm long overall. Palea 1 length of lemma.

Flower and Fruit. Anthers 3, 3 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil South.
Rio Grande do Sul.

Andropogon bentii Stapf. *Kew Bull.* 1907, 224. (1907).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Somalia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Socotra: *Balfour 764* (K syn); Socotra: *Bent* (K syn).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of James Theodore Bent (1852–1897) English traveller, archeologist and naturalist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms erect or geniculately ascending, 20–30 cm long. Lateral branches suffrutescent. Leaf-sheaths smooth. Ligule an eciliate membrane. Leaf-blades 1–2 cm long, 0.5–1.5 mm wide, glaucous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Peduncle 2–3 cm long, pilose above. Racemes 1–2, single or paired, 1–2 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs white, 2–3 mm long. Rhachis internodes filiform, 3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas or male, lanceolate, dorsally compressed, 5 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, 7–9 -veined, glabrous, acute. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume lanceolate, 1 length of spikelet, chartaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, membranous, 1-keeled, 3 -veined. Upper glume margins ciliate. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 3 mm long, hyaline, 2 -veined, ciliolate on margins. Fertile lemma lanceolate, 2.5 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.33 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8 mm long overall, with twisted column. Column of lemma awn glabrous. Palea oblong, 1.5 mm long.

Flower and Fruit. Anthers 3, 2 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Socotra.

Andropogon bicornis L. Sp. Pl. 1046. (1753).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Derivation (Clifford & Bostock 2007): *L. bi-*, two; *cornus*, horn. Spikelets paired.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 150–250 cm long, 4–6 mm diam. Culm-internodes thick-walled. Culm-nodes glabrous. Lateral branches ample. Leaf-sheaths keeled. Ligule a ciliolate membrane, 1–1.2 mm long. Leaf-blades 25–50 cm long, 2–6 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous.

Inflorescence. Synflorescence compound, paniculate (obovate), dense.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole linear, 3–4 cm long. Racemes 2, paired, 2.5–3.5 cm long. Rhachis fragile at the nodes, plumose on surface, plumose on margins. Rhachis hairs 6–8 mm long. Rhachis internodes

filiform, 2.5–3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 3–4 mm long, plumose, with 6–8 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels or rudimentary (except terminal), 0–1 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3–3.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus oblong, 0.2 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 2–2.4 mm long, hyaline, 0 -veined, ciliate on margins. Fertile lemma lanceolate, 1.6–2.2 mm long, hyaline, without keel. Lemma apex entire, acute, muticous. Palea absent or minute.

Flower and Fruit. Anthers 3, 0.5–0.7 mm long, purple. Caryopsis with adherent pericarp, 1.6–2 mm long.

Andropogon bogotensis (Hack.) Zanin. *Novon* 13:372 (2003).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Colombia. **Basionym or Replaced Name:** *Andropogon incanus* var. *bogotensis* Hack., *DC., Monogr. Phan.* 6:433 (1889). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Colombia, Llano de S. Martin: Karsten (W holo).

Illustrations (Journals): *Novon* (13: 374 Fig 4 (2003)).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Bogota, Colombia.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Andropogon bourgeaei Hack. *Flora*, 68: 134. (1885).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Bourgeau 2645*, Mexico: Veracruz: Orizaba (P; IST: MO, US-75537 (fragm. ex ST)). ST: *Liebmann 505*, Mexico: Mirador.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Eughne Bourgeau (1813–1877) French botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms 100–150 cm long. Lateral branches sparse. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane. Leaf-blades 10–30 cm long, 4–6 mm wide. Leaf-blade surface scabrous, glabrous or pubescent. Leaf-blade margins scabrous. Leaf-blade apex acute.

Inflorescence. Synflorescence compound, scanty.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 5–6 cm long. Peduncle antrorsely scabrous above. Racemes 2–3, paired or digitate, 4–6 cm long. Rhachis fragile at the nodes, plumose on margins. Rhachis internodes filiform, 4–5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 4–5 mm long, plumose.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 5–5.5 mm long, longer than fertile. Companion sterile spikelet glumes chartaceous, 5 -veined, glabrous, acute.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled dorsally. Lower glume primary vein scabrous. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma lanceolate, hyaline, without keel, 1 -veined, 0–3 -veined. Lemma apex entire, muticous.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Gulf (Mexico), Southwest Mexico, Southeast Mexico. Mesoamerica. Belize.

Veracruz. Oaxaca. Chiapas, Tabasco, Yucatan.

Andropogon brachystachyus Chapm. Fl. S. Un. St. Suppl. 668. (1883).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: USA, Florida: *Curtiss 3632* (US lecto, DUKE, FSU, GA, GH, MO, NCU, US).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (662).

Derivation (Clifford & Bostock 2007): Gk. *brachys*, short; *stachys*, ear of corn. Inflorescence comprised of short branches or spikelets short.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 60–150 cm long. Culm-internodes distally pilose. Lateral branches ample. Leaf-sheaths keeled, smooth, glabrous on surface. Ligule an eciliate membrane. Leaf-blades erect, conduplicate, 15–30 cm long, 3–4 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Synflorescence compound, linear or paniculate.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, exerted or embraced at base by subtending leaf. Spatheole linear, 3–3.5 cm long. Racemes 2, paired, 1–2 cm long, bearing 4–6 fertile spikelets on each. Rhachis fragile at the nodes, villous on margins. Rhachis hairs 3 mm long. Rhachis internodes filiform, 1.5–2 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, curved, 2.5–4 mm long, villous, with 3 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the

lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3–4.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, cartilaginous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface flat or concave, pubescent. Upper glume lanceolate, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight, 6–9 mm long overall.

Flower and Fruit. Anthers 1.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA. Florida, Georgia.

Andropogon brasiliensis A.Zanin & Longhi-Wagner. *Novon* 13(3): 368 . (2003).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Minas Gerais, Congonhas do Norte, Serra da Carapina, Mar 1998, *R.C.Forza, J.R.Pirani, A.C.Maccato, M.C. Assis & A.Rapini* 694 (holo:SPF; iso FLOR, K).

Illustrations (Journals): *Novon* (13: 369 Fig 1 (2003)), *Revista Brasil. Bot.* (29: 296, Fig.4–5 (2006)).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Brazil.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 34–64 cm long, 3–5 -noded. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches sparse. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface. Ligule a ciliolate membrane, 0.2–0.6 mm long. Leaf-blades flat or conduplicate, 3.5–17 cm long, 0.5–2 mm wide. Leaf-blade surface puberulous, hairy adaxially. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex abruptly acute or acute.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 5.5–11 cm long. Peduncle 8–19 cm long. Racemes 2–3(–5), paired or digitate, 2.5–6 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis internodes linear, 2–3(–4) mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 2–3(–4) mm long, villous.

Sterile Spikelets. Companion sterile spikelets well-developed, lanceolate, 2–5 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4.5–6.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally, 4 -veined. Lower glume primary vein scaberulous. Lower glume intercarinal veins absent. Lower glume surface concave. Lower glume apex dentate, 2 -fid. Upper glume linear, 4.1–5 mm long, coriaceous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume margins ciliate. Upper glume apex acute or acuminate, muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3.9–4.5 mm long, hyaline, 2 -veined, ciliate on margins, fringed above. Fertile lemma lanceolate, 3–4 mm long, 0.4–0.9 mm wide, hyaline, without keel, 3 -veined, 0–3 -veined. Lemma margins ciliate. Lemma apex lobed, 2 -fid, incised 0.25–0.33 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 16–22 mm long overall, with a straight or slightly twisted column. Column of lemma awn glabrous. Palea 1.2–2.8 mm long, hyaline, 0 -veined, without keels. Palea apex entire or erose, acute, glabrous or ciliate.

Flower and Fruit. Lodicules 2, 0.7 mm long. Anthers 3, 0.7–1.2 mm long, yellow. Caryopsis 1.5–1.8 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

Espirito Santo, Minas Gerais.

Andropogon brazzae Franch. *Bull. Soc. hist. nat. Autun.* 8: 326. (1895).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Congo & Zaire. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Brazza & Thollon 234*, Congo Francais: entre Mokeno et Mongo ST: *Fr. Hens 319*, Congo Belge: dans les sables secs a Staley pool.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Jacques de Brazza (1859–87) Belgian botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms erect, 100–200 cm long. Leaf-sheaths glabrous on surface. Ligule a ciliate membrane. Leaf-blades 10–15 cm long, 2–3 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Synflorescence compound, paniculate, 40–60 cm long.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 3–5 cm long. Racemes 3–15, digitate, 2.5–6 cm long. Rhachis fragile at the nodes, glabrous on surface, glabrous on margins. Rhachis internodes filiform, 3–5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 2–3 mm long, bearing a few hairs or glabrous.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 4 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, 3 -veined, glabrous, acute. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear or lanceolate, dorsally compressed, acute, 4 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus glabrous, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear or lanceolate, 1 length of spikelet, chartaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Lower glume apex acuminate. Upper glume linear, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3 mm long, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex entire, muticous. Palea oblong, 1–1.5 mm long, 0 -veined.

Flower and Fruit. Anthers 3, 2 mm long.

n = 10 (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, South Tropical Africa, Southern Africa. Congo, DRC. Angola, Zambia, Zimbabwe. Namibia, Botswana.

Andropogon burmanicus Bor. *Grasses Burma, Ceyl., Ind. / Pakist.* 688 (1960).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from Burma. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Burma, Salu Reserve: *U Thein Lwin* (K holotype).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ica*, belonging to. From Burma, now Myanmar.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms 100 cm long. Ligule an eciliate membrane. Leaf-blades 20–40 cm long, 1–4 mm wide. Leaf-blade surface pilose.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes 4–5, digitate, erect, 5–6 cm long. Rhachis fragile at the nodes, subterete, ciliate on margins. Rhachis hairs 1.5–2 mm long. Rhachis internodes cuneate, 3 mm long. Rhachis internode tip transverse, crateriform, with hairy rim. Spikelets squeezed between internode and pedicel, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion

sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, 3 mm long, ciliate, hairy all along but hairs longer above (around rim), with 1.5–2 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 3.5 mm long, shorter than fertile, persistent. Companion sterile spikelet glumes chartaceous, keeled, concave, ciliate on margins, acute, mucous. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, dorsally compressed, 4.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume intercarinal veins absent. Lower glume surface deeply depressed. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume awned, 1 -awned, awn 3 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, 3.5–4 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, incised 0.33 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 20 mm long overall, with twisted column. Column of lemma awn glabrous. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. Anthers 3, 2.5 mm long.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Myanmar.

Andropogon cabanisii Michx. *Fl. Bor. Am.* 1: 57 (1803).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: USA, Carolina: Coll? (P holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Jean Louis Cabanis (1816–1906) who collected in south-eastern USA.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms 60–100 cm long. Lateral branches ample. Leaf-sheaths smooth or scaberulous, glabrous on surface or hirsute. Ligule an eciliate membrane. Leaf-blades 12–25 cm long, 2–4 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole linear, 6–8 cm long. Peduncle 4–7 cm long, hirsute above. Racemes 2, paired, 4–7 cm long, bearing 15 fertile spikelets on each. Rhachis fragile at the nodes, plumose on margins. Rhachis hairs 5 mm long. Rhachis internodes linear, 4–6 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 3–5 mm long, plumose, with 5 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, linear, 3–3.5 mm long, shorter than fertile. Companion sterile spikelet glumes pubescent.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5–7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume primary vein ciliate. Lower glume intercarinal veins distinct, 2–3 in number. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled. Upper glume mucous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–20 mm long overall, with a straight or slightly twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA. Florida.

Andropogon campestris Trin. Mem. Acad. Petersb. Ser. 6, 2: 277. (1833).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil, S da Lapa: Langsdorff (LE holo).

Illustrations (Journals): *Revista Brasil. Bot.* (29: 296, Fig.6 (2006)).

Derivation (Clifford & Bostock 2007): L. of the field. Uncultivated.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms erect, 70–80 cm long. Culm-internodes distally glabrous. Lateral branches sparse. Leaf-sheaths glabrous on surface or pubescent. Ligule a ciliate membrane, truncate. Leaf-blade base tapering to the midrib. Leaf-blades convolute, 20–50 cm long, 1–1.5 mm wide, stiff. Leaf-blade surface glabrous, hairless except near base. Leaf-blade margins scabrous.

Inflorescence. Synflorescence compound, scanty.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Racemes 3–4, digitate, 6–8 cm long. Rhachis fragile at the nodes, plumose on margins. Rhachis hairs 3.5 mm long. Rhachis internodes filiform. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, plumose.

Sterile Spikelets. Companion sterile spikelets well-developed, comprising 2 unequal glumes without lemmas, lanceolate, 6–6.5 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, 9–11 -veined (lower) or 5–7 -veined (upper), acute.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear or lanceolate, dorsally compressed, 7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus glabrous, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled laterally, 7 -veined. Lower glume primary vein scabrous. Lower glume surface concave, glabrous. Upper glume linear, membranous, 1-keeled, 3 -veined. Upper glume primary vein scabrous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 3 -veined, ciliate on margins. Fertile lemma lanceolate, 4.5 mm long, hyaline, without keel. Lemma margins ciliate. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 5–6 mm long overall, with a straight or slightly twisted column. Column of lemma awn glabrous. Palea 2 mm long.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

Minas Gerais, Rio de Janeiro, Espirito Santo. Minas Gerais.

Andropogon canaliculatus Schum. *Beskriv. Guin. Pl.* 52. (1827).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ghana. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ghana: Thonning .

Illustrations: None found.

Derivation (Clifford & Bostock 2007): leaf-blades deeply channelled.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 25–200 cm long. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles absent or erect, 0–2 mm long. Ligule an eciliate membrane. Leaf-blades 10–40 cm long, 1–5 mm wide.

Inflorescence. Synflorescence simple or compound, linear.

Inflorescence composed of racemes, terminal or terminal and axillary, subtended by an unspecialized leaf-sheath or a spatheole. Racemes 2, paired, bilateral (as to sterile spikelets), 3–9 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes cuneate or inflated. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate or inflated, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 3.5–6 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, scaberulous, glabrous, acute, mucicous or mucronate. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, laterally compressed, 4–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface deeply depressed. Upper glume linear, chartaceous, 1-keeled. Upper glume mucicous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 7–15 mm long overall, with twisted column. Column of lemma awn glabrous.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa. Burkina, Ghana, Guinea, Ivory Coast, Mali, Nigeria. Rwanda, DRC. Ethiopia (inc. Eritrea). Kenya, Tanzania, Uganda. Mozambique, Zimbabwe.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Distribution (TDWG). Continent. South America.

Andropogon carinatus Nees. *Agrost. Bras.* 2: 330. (1829).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *F. Sellow s.n.*, Brazil: southern Brazil (B; IT: LE-TRIN-0177.02, US-75532).

Illustrations (Journals): *Revista Brasil. Bot.* (29: 296, Fig.7 (2006)).

Derivation (Clifford & Bostock 2007): *L. carina*, keel; *-atus*, possessing. Spikelets with keeled lemmas or glumes.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms 50 cm long. Ligule an eciliate membrane. Leaf-blades 7–20 cm long, 2–3 mm wide. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence composed of racemes. Racemes 2–3, paired or digitate, 2–4 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis hairs evenly distributed, 4 mm long. Rhachis internodes linear, 4 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 4 mm long, villous, hairy all along, with 4 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 5 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface concave or deeply depressed. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8–12 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

Distribution (TDWG). South America.

Country /Province /State. Mesoamerica, Western South America, Brazil. Costa Rica. Bolivia. Brazil West Central, Brazil Southeast.

Mato Grosso, Goiás, Minas Gerais, Rio de Janeiro, Espirito Santo. Distrito Federal, Mato Grosso, Goiás. Minas Gerais, Sao Paulo.

Andropogon chevalieri Reznik. *Bull. Mus. Hist. Nat. Paris* Ser. 2, 5: 497. (1933).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Guinea. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Guinea, Mali: *Chevalier*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Jean Baptiste Auguste Chevalier (1873–1956) French botanist and collector in tropical Africa, SE Asia and Brazil.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 200–250 cm long. Leaf-sheath auricles erect, 3–10 mm long. Ligule an eciliate membrane, 3–10 mm long. Leaf-blade base tapering to the midrib. Leaf-blades 20–40 cm long, 2–8 mm wide.

Inflorescence. Synflorescence compound, paniculate, 6–20 cm long, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole lanceolate, 5–8 cm long. Racemes 2, paired, 4–6 cm long. Rhachis fragile at the nodes, puberulous on surface, ciliate on margins. Rhachis internodes filiform, 4 mm long. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, 3 mm long, puberulous (on margins, pubescent on surface), tip lobed (bilobed).

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas or male, elliptic, dorsally compressed, 5–10 mm long, as long as fertile, separately deciduous. Companion sterile spikelet glumes chartaceous, 12 -veined, glabrous or pubescent, acute, awned, one glume awned, with 5–10 mm long awn. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 5.5–10 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus square, 1 mm long, pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume primary vein scabrous. Lower glume surface convex or with a longitudinal median groove, pubescent, hairy in lines (along midline). Lower glume apex acute. Upper glume elliptic, chartaceous, 1-keeled, 3 -veined. Upper glume surface pubescent. Upper glume apex truncate, mucronate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 6–7 mm long, hyaline, 2 -veined, ciliate on margins. Fertile lemma oblong, 5 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, incised 0.33 of lemma length, awned,

1 -awned. Principal lemma awn from a sinus, geniculate, 18–25 mm long overall, with twisted column. Column of lemma awn glabrous. Palea 0.75 length of lemma.

Flower and Fruit. Anthers 3, 3 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Guinea-Bissau, Guinea, Mali.

Andropogon chinensis (Nees) Merrill. *Philipp. Journ. Sc., Bot.* 12: 101 (1917).

Images: G.E.Gibbs Russell et al, *Grasses of Southern Africa* (1990);, F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From China.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 60–200 cm long. Leaf-sheath auricles absent or erect, 0–4 mm long. Ligule an eciliate membrane. Leaf-blades 10–40 cm long, 1–8 mm wide, glaucous. Leaf-blade surface glabrous or pubescent.

Inflorescence. Synflorescence compound.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Racemes 2, paired, 3–7(–10) cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 1–3 mm long. Rhachis internodes cuneate. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, ciliate, with 1–3 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate or elliptic, dorsally compressed, 4–7 mm long, shorter than fertile. Companion sterile spikelet glumes membranous, glabrous to pilose, acute, awned, both glumes awned, with (2–)4–10 mm long awn. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, laterally compressed, 5–8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface deeply depressed, glabrous. Upper glume linear, chartaceous, 1-keeled. Upper glume awned, 1 -awned, awn (1–)4–12 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 20–35 mm long overall, with twisted column. Column of lemma awn glabrous. Palea oblong, 0 -veined, without keels.

Flower and Fruit. *n* = 10 (2 refs TROPICOS, 1 as *A. patris*), or 20 (2 refs TROPICOS, 1 as *A. asconodis*).

Distribution (TDWG). Continent. Africa, Temperate Asia, Tropical Asia.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa. Andropogon chrysostachyus Steud. *Syn. Pl. Gram.* 377. (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ethiopia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ethiopia, Debra Eski: *Schimper 1010* (K iso).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (326, Fig. 131).

Derivation (Clifford & Bostock 2007): Gk. *chrysos*, yellow; *stachys*, ear of corn. Panicle branches invested in golden-yellow hairs.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths glabrous. Culms 10–100 cm long. Ligule an ciliate membrane. Leaf-blades flat, 2–40 cm long, 1–5 mm wide.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes (2–)3–9, digitate, 3–8 cm long. Central inflorescence axis 0–4 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs dark brown. Rhachis internodes filiform or linear. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform or linear, ciliate, with dark brown hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 4–8 mm long, as long as fertile, persistent. Companion sterile spikelet glumes chartaceous, glabrous or pubescent, acute, muticous. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 5–8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus cuneate, 1 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic, 1 length of spikelet, coriaceous, dark brown, 2-keeled, keeled laterally. Lower glume intercarinal veins distinct, 4–7 in number. Lower glume surface flat, pubescent. Lower glume hairs dark brown. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.33–0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8–20 mm long overall, with twisted column. Column of lemma awn glabrous. Palea hyaline, 0 -veined, without keels.

Distribution (TDWG). Continent. Africa.

Country /Province /State. **Northeast Tropical Africa, East Tropical Africa.** Ethiopia (inc. Eritrea). Kenya, Tanzania.

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *M. Cardenas* 2083, 2 Nov 1937, Bolivia: Cochabamba (US-1760631).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (595, Fig. 141).

Derivation (Clifford & Bostock 2007): *L. cordus*, heart; *-ata*, possessing. Bases of leaf-blades cordate.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, robust, 200–250 cm long. Ligule an eciliate membrane. Leaf-blade base amplexicaul. Leaf-blades 10–30 cm long, 15–22 mm wide. Leaf-blade surface glabrous. Leaf-blade apex acuminate.

Inflorescence. Synflorescence compound, linear, 30–90 cm long.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Racemes 2–3, paired or digitate, 2–3.5 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis internodes linear. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, villous.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas or male, linear, 4–6 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, 4–5 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–18 mm long overall, with a straight or slightly twisted column. Column of lemma awn glabrous.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

Andropogon crassus Sohns. *Mem. N. Y. Bot. Gard.* 9: 405 (1957).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Venezuela, Chimanta massif: Steyermark 75515 (US holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. thick*. Racemes thick.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 100–200 cm long. Culm-nodes glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1.5 mm long. Leaf-blades 20–45 cm long, 10–20 mm wide. Leaf-blade surface glabrous, hairless except near base. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Synflorescence compound, linear.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, enclosed. Spatheole linear. Racemes 1, single, 1–4 cm long. Rhachis fragile at the nodes, with scattered hairs, ciliate on margins. Rhachis internodes clavate, 3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 2.5 mm long, ciliate, hairy on margins.

Sterile Spikelets. Companion sterile spikelets well-developed, comprising 2 subequal glumes without lemmas, linear, 3–4 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4–4.2 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally, 4 -veined. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume muticous.

Florets. Basal sterile florets 1, barren, with palea or without significant palea. Lemma of lower sterile floret oblong, 2.8–4 mm long, hyaline, 3 -veined, ciliolate on margins. Palea of lower sterile floret 0–2 mm long. Fertile lemma lanceolate, 2–3.2 mm long, hyaline, without keel, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 5–8 mm long overall, with a straight or slightly twisted column. Column of lemma awn glabrous. Palea 2–2.5 mm long, hyaline.

Flower and Fruit. Lodicules 2, 0.5–0.7 mm long. Anthers 3, 1.5–1.8 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Andropogon crispifolius G.F. Guala & T.S. Filgueiras. *Nordic J. Bot.* 15(1): 59 (1995).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil, Mineiros: *Filgueiras 2304* (IBGE holo, FLAS, K, ICN, ISC, MO, SI, SO, US).

Illustrations (Journals): *Revista Brasil. Bot.* (29: 296, Fig.8 (2006)).

Derivation (Clifford & Bostock 2007): *L. crispus*, coiled; folium, leaf. Leaf-blades coiled.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short, scaly. Culms erect, 100–170 cm long, 2.5–4 mm diam. Culm-internodes terete or channelled, solid, 2.5–18 cm long, distally pubescent. Culm-nodes swollen, glabrous. Lateral branches lacking or sparse. Leaves cauline, 17–50 per branch. Leaf-sheaths 2–9.2 cm long, longer than adjacent culm internode, outer margin glabrous or hairy. Leaf-sheath oral hairs scanty or ciliate. Leaf-sheath auricles erect. Ligule a ciliolate membrane, 0.4–0.6 mm long. Leaf-blades tortuous, lanceolate, 7.1–25 cm long, 9–20 mm wide, glaucous. Leaf-blade midrib conspicuous. Leaf-blade venation with 10–18 secondary veins. Leaf-blade surface glabrous.

Inflorescence. Synflorescence compound, scanty.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Peduncle 11.1–18.3 cm long. Racemes 2, paired, 6–9.2 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes cuneate. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, 4–6 mm long, ciliate, with 3–4.5 mm long hairs, tip cupuliform.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas or male, lanceolate, 5.9–10 mm long, as long as fertile, separately deciduous. Companion sterile spikelet glumes chartaceous, keeled, scabrous, glabrous, acute, muticous. Companion sterile spikelet lemmas 2, enclosed by glumes, 4.7–5.6 mm long, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 6.2–9 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface deeply depressed, scabrous. Lower glume apex dentate, 2 -fid. Upper glume linear, coriaceous, 1-keeled. Upper glume surface scabrous. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 4.6–4.7 mm long, hyaline, 2 -veined. Fertile lemma lanceolate, 4–4.3 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.25 of lemma length, awned, 1 -awned. Principal lemma awn from a

sinus, geniculate, 10–18 mm long overall, with twisted column. Column of lemma awn glabrous. Palea 2.9–3.1 mm long. Palea keels scabrous.

Flower and Fruit. Lodicules 2, 0.4–0.7 mm long, truncate. Anthers 1 or 2, 0.6–0.7 mm long. Caryopsis 0.6 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central.

Distrito Federal, Goiás, Mato Grosso do Sul.

Andropogon crossotus T.A. Cope. *Kew Bull.* 39(4): 833 (1984).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Yemen. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Yemen, Sanaa: *Wood 2023* (K holo, BM).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *krossos*, tassel.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 25–40 cm long. Ligule an eciliate membrane. Leaf-blades 3.5–7 cm long, 1.5–2 mm wide, glaucous. Leaf-blade surface pubescent, hairy adaxially.

Inflorescence. Synflorescence compound, scanty.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Racemes 2, paired, 2–3 cm long. Rhachis fragile at the nodes, pubescent on surface, ciliate on margins. Rhachis internodes clavate. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, clavate, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, lanceolate, 3.7–4.5 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, smooth, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, subterete, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic or oblong, 1 length of spikelet, membranous, 2-keeled, keeled dorsally. Lower glume intercarinal veins absent. Lower glume surface deeply depressed. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 3.5 mm long, hyaline, 2 -veined. Fertile lemma lanceolate, 3.5 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–15 mm long overall, with twisted column. Column of lemma awn glabrous. Palea ovate, 1 mm long. Palea apex obtuse.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa, Temperate Asia.

Country /Province /State. Northeast Tropical Africa. Somalia. Arabian Peninsula. Yemen.

Andropogon crucialis S.A. Renvoize. *Gramineas de Bolivia*: 596 (1998).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Bolivia: Santa Cruz: Chavez, 15 km S de Concepcin, *Killeen 2484* (HT: LPB: IT: F, MO).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (597, Fig. 142).

Illustrations (Journals): *Revista Brasil. Bot.* (29: 296, Fig.9–10 (2006)).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. From Santa Cruz, Bolivia.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths purple. Basal innovations flabellate. Culms erect, 150 cm long. Ligule an eciliate membrane. Leaf-blades flat or conduplicate, 25–45 cm long, 2–4 mm wide, firm, glaucous. Leaf-blade surface glabrous. Leaf-blade apex abruptly acute, hooded.

Inflorescence. Synflorescence compound, linear, 25 cm long, dense.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Peduncle tipped by a glumaceous appendage (5–10mm long). Racemes 1, paired or digitate, 2–2.5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 3–4 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3–3.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface flat. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel. Lemma apex muticous.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil. Bolivia.

Andropogon curvifolius W. D. Clayton. *Kew Bull.* 17: 465 (1964).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Ghana. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ghana, Krabo Hill: *Rose-Innes 30861* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. curvus*, bent; folium, leaf. The leaf-blades become spirally coiled in senescence, or on drying.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 70–100 cm long, 3–5 -noded. Leaf-sheath oral hairs ciliate. Ligule a ciliolate membrane, 0.5–1 mm long. Leaf-blades curved, filiform, involute, 30–60 cm long, 0.3–0.7 mm wide. Leaf-blade apex attenuate.

Inflorescence. Synflorescence compound, scanty, 30 cm long.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 4–7 cm long. Racemes 2, paired, flexuous, 3–4 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 1–3 mm long. Spikelet packing lax. Rhachis internodes filiform, 4–5 mm long. Rhachis internode tip transverse, cupuliform, with lobed rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 4–6 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, 7 -veined, acute, awned, one glume awned, with 1–4.5 mm long awn. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, acuminate, 4.5–6.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus square, 0.5 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled laterally. Lower glume primary vein scaberulous. Lower glume lateral veins several in each keel (2–3), intercarinal veins absent. Lower glume surface concave. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, membranous, 1-keeled, 3 -veined. Upper glume apex acute, mucronate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 5 mm long, hyaline, 2 -veined, ciliate on margins, acute. Fertile lemma oblong, 3–4 mm long, hyaline, without keel. Lemma margins ciliolate. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 16–22 mm long overall, with twisted column. Column of lemma awn 6–8 mm long, glabrous. Palea 0.1 length of lemma.

Flower and Fruit. Lodicules 2, oblong, 0.5 mm long, ciliate.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Ghana, Guinea, Ivory Coast, Liberia.

Andropogon distachyos L. *Sp. Pl.* 1046. (1753).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Europe, Switzerland. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: CT: Herb. Burser I: 120 (UPS). LT designated by Clayton & Renvoize, *Fl. Trop. E. Afr. Gramineae* (3): 770 (1982); CT proposed by Jarvis, *Taxon* 41: 556 (1992).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): Gk. *dis*, twice; *stachys*, an ear of corn. Inflorescence two-branched inflorescence.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths pubescent. Culms 25–100 cm long. Ligule an eciliate membrane. Leaf-blades 7–20 cm long, 1–5 mm wide.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes 2, paired, 4–14 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear or clavate (slightly). Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear or clavate (slightly), ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 6–11 mm long, shorter than fertile, persistent. Companion sterile spikelet glumes herbaceous, dentate, 2 -fid, acuminate, awned, one glume awned, with 3–9 mm long awn. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 8–16 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus oblong, 1–2 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, asymmetrical, 1 length of spikelet, herbaceous or coriaceous, much thinner above, 2-keeled, keeled laterally, winged on keel, winged broadly, winged above (0.5–0.66 length). Lower glume intercarinal veins distinct, 7–11 in number. Lower glume surface convex or flat or concave, glabrous or pubescent. Lower glume apex dentate, 2 -fid, caudate. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume awned, 1 -awned, awn 4–10 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–30 mm long overall, with twisted column. Column of lemma awn glabrous. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. *n* = 18 (1 ref TROPICOS).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.A. Steyermark & J.J. Wurdack 492*, 5 Feb 1955, Venezuela: Bolmvar: Chimanta Massif, Central Section, vicinity of Summit Camp along Rmo Tirica, in small clumps, spikelets white, leaves gray green, locally frequent, alt. 1925 m (US-2182125; IT: VEN-45172).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (22, Fig. 5).

Derivation (Clifford & Bostock 2007): L. long lasting. Densely tufted perennial.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 20–65 cm long. Leaves cauline. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs lacking or ciliate. Leaf-sheath auricles erect. Ligule a ciliate membrane, 1.5–1.7 mm long. Leaf-blades 5–15 cm long, 0.5–5 mm wide. Leaf-blade midrib prominent beneath. Leaf-blade surface smooth or scaberulous, rough on both sides.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes (1–)2, paired, 4–5 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis hairs evenly distributed. Rhachis internodes filiform. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 3–5 mm long, villous, hairy all along.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, linear, 1.1–2.3 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4.1–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 0.9–1.5 mm long, hyaline, 2 -veined, ciliolate on margins. Fertile lemma lanceolate, hyaline, without keel, 3 -veined, 0–3 -veined. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 7.5–14 mm long overall, with twisted column. Column of lemma awn glabrous. Palea 1–2 mm long.

Flower and Fruit. Lodicules 2, cuneate, 0.5–0.7 mm long, fleshy. Anthers 3, 1–1.5 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): Gk. *eu-*, well; *kome*, head of hair. Raceme joints silky with soft, long hairs.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–200 cm long. Ligule an eciliate membrane. Leaf-blades conduplicate, 4–30 cm long, 1–3 mm wide. Leaf-blade apex abruptly acute.

Inflorescence. Synflorescence simple or compound, scanty, open.

Inflorescence composed of racemes, terminal or terminal and axillary, subtended by a spatheole. Spatheole linear, 5–9 cm long. Racemes 2–6, paired or digitate, sinuous, 2–8 cm long. Rhachis fragile at the nodes, plumose on margins. Rhachis hairs 3–10 mm long. Rhachis internodes filiform, 4–5 mm long.

Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets ascending, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, curved, 4–5 mm long, plumose, with 3–10 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels or rudimentary, linear or lanceolate, 0–2.5 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous or awned, one glume awned, with 0–3 mm long awn.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear or lanceolate, dorsally compressed, 2–7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear or lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear or lanceolate, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 0–2 -veined, without midvein, without lateral veins or without lateral veins, ciliate on margins. Fertile lemma lanceolate or oblong, hyaline, without keel. Lemma margins ciliolate. Lemma apex lobed, 2-fid, incised 0.25–0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, flexuous or geniculate, 8–20 mm long overall, without a column or with a straight or slightly twisted column. Column of lemma awn glabrous. Palea present or absent or minute, oblong.

Flower and Fruit. Anthers 3, 1.5 mm long.

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (496).

Derivation (Clifford & Bostock 2007): *L. exaro*, plough up. With furrows between the nerves of the glumes.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms robust, 100–200 cm long. Ligule an eciliate membrane. Leaf-blades 5–8 mm wide.

Inflorescence. Synflorescence compound, scanty.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Racemes 2–6, paired or digitate, 5–10 cm long. Rhachis fragile at the nodes, pubescent on margins. Rhachis hairs 0.5 mm long. Rhachis internodes cuneate, 3 mm long. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, 2.5 mm long, pubescent, with 0.5 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 6 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the

lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus glabrous, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, 5 mm long, hyaline, without keel. Lemma apex lobed, 2-fid, incised 0.33 of lemma length, awned, 1-awned. Principal lemma awn from a sinus, geniculate, 8–10 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

$2n = 60$ (also $60+2B$, 1 ref TROPICOS).

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Paraguay.
Corrientes, Misiones.

Andropogon festuciformis Rendle. *Cat. Welw. Afr. Pl.* 2: 145. (1899).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Angola. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Angola, Humpata: *Welwitsch 7505* (K).

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (517, Fig. 412, as *Hypogynium schlechteri*).

Derivation (Clifford & Bostock 2007): *L. forma*, appearance. Resembling *Festuca* in habit or inflorescence.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Basal innovations flabellate. Culms erect, 60–100 cm long. Ligule a ciliolate membrane. Leaf-blades flat or conduplicate, 10–25 cm long, 2–4 mm wide, stiff.

Inflorescence. Synflorescence compound, paniculate, 15–30 cm long, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole linear, 1.5–2 cm long, herbaceous. Peduncle pubescent above. Racemes 1, single, 6–12 cm long. Rhachis fragile at the nodes, subterete, glabrous on margins. Rhachis internodes linear, 1–1.5 mm long. Rhachis internode tip transverse, flat, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 0.5–1 mm long, glabrous, tip rectangular.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 3–4 mm long, shorter than fertile, persistent. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3.5–4.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus oblong, 0.8 mm long, glabrous, base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled above. Lower glume primary vein scaberulous. Lower glume intercarinal veins absent. Lower glume surface flat. Lower glume apex acute. Upper glume lanceolate, coriaceous, 1-keeled, 1-veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume margins ciliolate. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 2 mm long, 0.5 length of spikelet, hyaline, 2-veined. Fertile lemma linear, 2 mm long, hyaline, without keel, 1-veined, 0–3-veined, one-veined. Lemma apex entire, muticous. Palea absent or minute.

Flower and Fruit. Anthers 3, 1.6–2 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, South Tropical Africa, Southern Africa. Guinea, Mali. DRC. Angola, Malawi, Zambia. Kwazulu-Natal.

Andropogon floridanus Scribn. *Bull. Torr. Bot. Club*, 1896, 145. (1896).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Florida. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: USA, Florida: *Nash 1572* (US holo, GH).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 25 Poaceae*, part 2 (2003) (658).

Derivation (Clifford & Bostock 2007): *L.-ana*, indicating location. From Florida State, USA.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–160 cm long. Lateral branches ample. Leaf-sheaths antrorsely scabrous. Ligule an eciliate membrane. Leaf-blades 25–50 cm long, 2–6 mm wide. Leaf-blade surface scabrous.

Inflorescence. Synflorescence compound, paniculate.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, exerted or embraced at base by subtending leaf. Spatheole linear or lanceolate, 4–5 cm long. Peduncle 1 cm long or 2 cm long, hirsute above. Racemes 2, paired, 3–4 cm long. Rhachis fragile at the nodes, plumose on margins. Rhachis hairs 5–8 mm long. Rhachis internodes clavate, 3–3.5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, curved, 4–5 mm long, plumose, with 5–8 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels or represented by single glumes, linear, 1 mm long, shorter than fertile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3.5–4 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume primary vein ciliate. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight or geniculate, 8–12 mm long overall, with a straight or slightly twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 1.

n = 10 (1 ref TROPICOS).

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA. Florida, Georgia.

Andropogon gabonensis Stapf. *Journ. de Bot.* 22: 207 (1909).

TYPE from Gabon. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Gabon, Cape Lopez: Chevalier 4336 (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Gabon.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms robust, 200–300 cm long. Ligule a ciliolate membrane, 2–3 mm long. Collar without external ligule. Leaf-blade base tapering to the midrib. Leaf-blades 30–60 cm long, 10–25 mm wide. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Synflorescence compound, paniculate, 60–90 cm long, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole lanceolate or elliptic, 5–7 cm long, scarious or herbaceous. Racemes 2, paired, 3.5–5 cm long. Rhachis

fragile at the nodes, glabrous on surface or pubescent on surface, pubescent on margins (sparsely). Rhachis internodes oblong. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, clavate, pubescent (sparsely), tip lobed (bilobed).

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 4–4.5 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, 7–11 -veined, glabrous or pubescent, acute, muticous or mucronate. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins distinct. Lower glume surface flat or with a longitudinal median groove, glabrous or pubescent, hairy in lines (along midline). Upper glume lanceolate, chartaceous, 1-keeled, 3 -veined. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined, ciliate on margins. Fertile lemma oblong, hyaline, without keel, 1–3 -veined, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 9–12 mm long overall, with twisted column. Column of lemma awn glabrous. Palea oblong.

Flower and Fruit. Anthers 3, 3 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, South Tropical Africa. Cameroon, Congo, DRC. Angola.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);, F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): L. -ana, indicating connection. In honor of Claude Gay (1800–1873) French botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 150–250 cm long. Ligule an eciliate membrane. Collar without external ligule or with external ligule. Leaf-blade base tapering to the midrib, without a false petiole or with a false petiole. Leaf-blades 30–60 cm long, 4–20 mm wide.

Inflorescence. Synflorescence compound, paniculate, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole lanceolate, 6–8 cm long, herbaceous. Racemes 2, paired, 4–9 cm long. Rhachis fragile at the nodes, glabrous on surface, ciliate on margins. Rhachis internodes cuneate. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, 4–5 mm long, ciliate, tip lobed.

Sterile Spikelets. Companion sterile spikelets well-developed, male, elliptic, dorsally compressed, 5–8 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, glabrous or pubescent or

villous, acute, awned, one glume awned or both glumes awned, with 1–10 mm long awn. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 5–8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus oblong, 1 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins distinct. Lower glume surface flat or with a longitudinal median groove, glabrous. Upper glume lanceolate, chartaceous, 1-keeled. Upper glume muticous or mucronate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–30 mm long overall, with twisted column. Column of lemma awn glabrous.

Derivation (Clifford & Bostock 2007): in honor of John Gerard (1545–1612) English botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent or short. Culms 80–200 cm long. Lateral branches sparse. Ligule a ciliolate membrane. Leaf-blades 5–10 mm wide, mid-green or glaucous. Leaf-blade surface glabrous or hirsute. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes 2–7, paired or digitate, 4–11 cm long. Rhachis fragile at the nodes, glabrous on surface, pubescent on margins or ciliate on margins. Rhachis hairs 0.5–4 mm long. Rhachis internodes linear. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, pubescent or ciliate, with 0.5–4 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, elliptic, 7–11 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 7–11 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins obscure. Lower glume surface concave. Upper glume lanceolate, coriaceous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, hyaline. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2 -fid, muticous or awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 0–20 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3.

Derivation (Clifford & Bostock 2007): L. *glaucesco*, become glaucous. Foliage and/or other parts bluish-green.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–70 cm long. Culm-nodes pubescent. Ligule an eciliate membrane. Leaf-blades 3–6 mm wide.

Inflorescence. Synflorescence compound, linear.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 4.5 cm long. Racemes 2–3, paired or digitate, 4–5.5 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis hairs 4 mm long. Rhachis internodes linear, 3.5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 5 mm long, villous, with 4 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 5–6 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, 4.5–5 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 12–15 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia, Ecuador, Peru.

Andropogon glaucophyllus Roseng. Arrill. de Maffei & Izag. de Artucio. *Gramin. Urug.* 165 (1970).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uruguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *B. Rosengurttt B-2634B*, 10 Apr 1966, Uruguay: Montevideo: cult. in Hort. Bot. Facultad de Agronomía, Apr 1966; orig. Arroyo Los Rios, Rocha (MVFA; IT: SI, US-2887391).

Illustrations (Books): B.Rosengurttt, *Gramineas Uruguayas I* (1970) (166, Fig. 65).

Illustrations (Journals): *Revista Brasil. Bot.* (29: 297, Fig.14–15 (2006)).

Derivation (Clifford & Bostock 2007): Gk. *glaukos*, bluish-green; *phyllon*, leaf. Leaf-blades glaucous.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations intravaginal. Culms 100–200 cm long, 6–12 -noded. Culm-nodes glabrous. Leaf-sheaths 10–16.5 cm long, glabrous on surface. Ligule an eciliate membrane, 1.5–3 mm long, truncate. Leaf-blade base tapering to the midrib. Leaf-blades 17–40 cm long, 3–7 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, subtended by a spatheole. Spatheole lanceolate, 10–18 cm long. Racemes 2–6, digitate, 3–12 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 1.6–2.8 mm long. Rhachis internodes clavate, 0.8 length of fertile spikelet. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, clavate, 0.6 length of fertile spikelet, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas or male, lanceolate, 4.2–5.8 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4.5–7.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted. Spikelet callus hairs 0.8–1.3 mm long.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume primary vein scaberulous. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, ciliate on margins. Fertile lemma lanceolate, 3.2–5 mm long, hyaline, without keel, 2–3 -veined, 0–3 -veined. Lemma margins ciliate. Lemma apex entire (when awnless) or dentate, 2 -fid, muticous or awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 0–5.5 mm long overall, with a straight or slightly twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3, 2–3.5 mm long. Caryopsis 2.2–4 mm long, dark brown.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil Southeast. Uruguay.

Andropogon glaziovii Hack. Mart. *Fl. Bras.* 2. 3: 286. (1883).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: A.F.M. Glaziou 11672, no date, Brazil: Rio de Janeiro (US-75522 (fragm. ex B)).

Illustrations (Journals): *Revista Brasil. Bot.* (29: 297, Fig.16–17 (2006)).

Derivation (Clifford & Bostock 2007): in honor of Auguste Frangois Marie Glaziou (fl. 1833–1906) French-born artist and Brazilian botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Basal innovations intravaginal. Culms 150–200 cm long, 5–6 mm diam. Leaf-sheaths smooth, glabrous on surface. Ligule a ciliolate membrane. Leaf-blades 15–50 cm long, 4–7 mm wide. Leaf-blade surface pilose, hairy abaxially. Leaf-blade apex abruptly acute.

Inflorescence. Synflorescence compound, linear, 20–50 cm long.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, enclosed. Spatheole lanceolate, 2.5–3 cm long. Racemes 2, paired, 2 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis hairs on upper part of internode, 4 mm long. Rhachis internodes linear, 3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, villous, hairy above, with 4 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, linear, 4 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2-fid, incised 0.33 of lemma length, awned, 1-awned. Principal lemma awn from a sinus, geniculate, 9–10 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

$n = 30$ (1 ref TROPICOS).

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil, Southern South America. Bolivia. Brazil Southeast. Paraguay.

Minas Gerais, Rio de Janeiro, Espirito Santo. Rio de Janeiro.

Andropogon glomeratus (Walt.) Britton Stern. et Poggenb. *Prel. Catal.* 67 (1888).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), W.D.Clayton & N.Snow, *Key to Pacific Grasses* (2010).

TYPE from USA. **Basionym or Replaced Name:** *Cinna glomerata* Walt., *Fl. Carol.* 59 (1788). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Walter s.n.*, USA: South Carolina (BM; IT: GH (fragm. ex BM & photo), NY (fragm.)).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (663 as varieties *glomeratus* & *pumilus* & *scabriglumis* & *glaucopsis* & *hirsutior*), F.W.Gould, *The Grasses of Texas* (1975) (585, Fig. 307), A.S.Hitchcock, *Manual of the Grasses of the West Indies* (1936) (397, Fig. 354), W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (43, Fig 43), E.Hafliger & E.Schultz, *Grass Weeds*, CIBA-GEIGY (1:4(1980)).

Images: R.Darke, *Ornamental Grasses* (2004);, R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);.

Derivation (Clifford & Bostock 2007): *L. glomus*, ball of thread; *-ata*, possessing. Spikelets crowded and forming clusters in the inflorescence.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations flabellate. Culms erect, 75–150 cm long. Leaf-sheaths keeled, glabrous on surface, outer margin glabrous or hairy. Ligule a ciliate membrane. Leaf-blades 2.5–6 mm wide.

Inflorescence. Synflorescence compound, paniculate (oblong), dense.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole lanceolate, 1.5–3 cm long. Peduncle 0.5–1 cm long, hirsute above. Racemes 2, paired, sinuous, 1.5–3 cm long. Rhachis fragile at the nodes, plumose on surface, plumose on margins. Rhachis internodes filiform. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, curved, plumose.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3–4.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, hyaline. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight, 10–20 mm long overall. Palea absent or minute.

Flower and Fruit. Anthers 3.

$n = 10$ (3 refs TROPICOS).

Andropogon gracilis Spreng. *Syst.* 1: 284. (1825).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Dominican Rep, Peru. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Anonymous s.n.*, no date, Dominican Republic / Haiti: Hispaniola I. (B; IST: US-75673 (fragm. ex B)). ST: *T. Haenke s.n.*, no date, Peru (BR; IST: US-3088250 (fragm. ex BR), US-75919).

Recent Synonyms: *Schizachyrium gracile* (Spreng.) Nash, Small, *Fl. S. E. U. S.* 60 (1903).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (654), A.S.Hitchcock, *Manual of the Grasses of the West Indies* (1936) (389, Fig. 349).

Derivation (Clifford & Bostock 2007): L. slender. Culms or inflorescences slender.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 20–80 cm long, wiry. Ligule an eciliate membrane. Leaf-blades filiform, terete, 4–30 cm long, 0.5–1 mm wide.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 1, single, sinuous, 2–5 cm long. Rhachis fragile at the nodes, plumose on margins. Rhachis hairs 2–3 mm long. Rhachis internodes cuneate, 3–4 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets

spreading, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, curved, 3–4 mm long, plumose, with 2–3 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, linear or lanceolate, 2–3 mm long, shorter than fertile, deciduous with the fertile. Companion sterile spikelet glumes membranous, acute, awned, with 1–1.5 mm long awn.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear or lanceolate, dorsally compressed, 3.5–5.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base obtuse, inserted. Spikelet callus hairs 2–3 mm long.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, cartilaginous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface flat. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, membranous, 1-keeled, 3 -veined. Upper glume apex acute, muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, hyaline, 2 -veined, acute. Fertile lemma oblong, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, incised 0.33 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–15 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Southeastern USA. Florida. Mesoamerica, Caribbean, Northern South America, Western South America, Southern South America. Belize, Costa Rica, Guatemala, Honduras, Nicaragua, Panama. Bahamas, Cuba, Dominican Republic, Haiti, Jamaica, Leeward Is, Puerto Rico. French Guiana, Guyana, Venezuela. Ecuador. Paraguay, Uruguay.

Andropogon greenwayi Napper. *Kirkia* 3: 121 (1963).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Tanzania. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Tanzania, Naabi Hill: *Greenway & Turner 10165* (EA holo, K).

Illustrations (Books): T.A.Cope, in M.Thulin, *Poaceae* (Gramineae). *Flora of Somalia* (1995) (261, Fig. 154).

Illustrations (Journals): *Kew Bulletin* (50: 110, Fig.1 (1995)).

Derivation (Clifford & Bostock 2007): in honor of Percy James Greenway (1897–1980) English botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, mat forming. Rhizomes absent or short. Butt sheaths glabrous. Culms 15–60 cm long. Ligule an eciliate membrane. Leaf-blades flat, 3–10 cm long, 1–4 mm wide.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes 2(–5), paired, 3–7 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs white. Rhachis internodes filiform or linear. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform or linear, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 5.5–10 mm long, shorter than fertile, persistent. Companion sterile spikelet glumes chartaceous, acute or acuminate, muticous. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear or lanceolate, dorsally compressed, 6.5–11 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus oblong, 1 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear or lanceolate, 1 length of spikelet, coriaceous, much thinner above, 2-keeled, keeled laterally, winged on keel, winged narrowly. Lower glume intercarinal veins distinct, 4–10 in number. Lower glume surface

convex or with a longitudinal median groove. Lower glume apex dentate, 2 -fid, acute or acuminate. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume apex acuminate, awned, 1 -awned, awn 0.5–4 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 14–20 mm long overall, with twisted column. Column of lemma awn glabrous. Palea hyaline, 0 -veined, without keels.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa, East Tropical Africa. Ethiopia (inc. Eritrea), Somalia. Kenya, Tanzania.

Andropogon gyrans Ashe. *Journ. E. Mitchell Sci. Soc.* 1898, 113. (1898).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Images: R.Darke, *Ornamental Grasses* (2004);, R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);.

Derivation (Clifford & Bostock 2007): *L. gyro*, turn round in a circle. Awns forming loose spirals on drying.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–80 cm long. Ligule a ciliolate membrane. Leaf-blades flat or conduplicate, 3–4 mm wide.

Inflorescence. Synflorescence compound, fasciculate.

Inflorescence composed of racemes, terminal and axillary, subtended by an inflated leaf-sheath or a spatheole, exerted or enclosed. Spatheole lanceolate. Peduncle flexuous, 1–15 cm long. Racemes 2, paired, 3–4 cm long. Rhachis fragile at the nodes, plumose on surface, plumose on margins. Rhachis internodes filiform, 8–10 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 8–10 mm long, 1.4 length of fertile spikelet, plumose.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined, ciliate on margins. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–15 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 1.

n = 10 (2 refs TROPICOS).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: USA, Nebraska: *Hall & Harbour 651*.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 25 Poaceae*, part 2 (2003) (654).

Images: R.Darke, *Ornamental Grasses* (2004);, R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);.

Derivation (Clifford & Bostock 2007): in honor of Elihu Hall (1822–82) United States farmer and amateur botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms 100–200 cm long. Lateral branches ample. Leaf-sheaths without keel, glabrous on surface. Ligule a ciliolate membrane, 2.5–4 mm long. Leaf-blades 5–10 mm wide. Leaf-blade surface glabrous or pilose, hairy adaxially, with tubercle-based hairs.

Inflorescence. Inflorescence composed of racemes, terminal or terminal and axillary. Racemes 2–4, paired or digitate, 4–6 cm long. Rhachis fragile at the nodes, plumose on margins. Rhachis hairs 2–4 mm long. Rhachis internodes clavate, 3–5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, clavate, 5–6 mm long, villous, with 2–4 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 9–10 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, acute, muticous. Companion sterile spikelet lemmas muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 9–10 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins distinct, 4 in number. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight, 1–5 mm long overall.

Flower and Fruit. Anthers 3, 3–4 mm long.

$2n = 60$ (1 ref TROPICOS).

Distribution (TDWG). Continent. North America.

Country /Province /State. **Western Canada, Eastern Canada, Northwest USA, North-central USA, Southwestern USA, South-central USA, Mexico.** Manitoba. Ontario, Quebec. Colorado, Montana, Wyoming. Iowa, Kansas, North Dakota, Nebraska, Oklahoma, South Dakota. Arizona, Utah. New Mexico, Texas. Northeast Mexico.

Andropogon heterantherus Stapf. *Kew Bull.* 1908, 409. (1908).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Holst 3073*, East Africa, Usambara, Maou [Muoa?] (K; IT: US-1037908 (fragm. ex K)).

Recent Synonyms: *Andropogon heteranthus* Steud, *Syn. Pl. Gram.* 370 (1854).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk *heteros*, different; *antheros*, blooming. Anthers of the sessile spikelets much smaller than those of the pedicelled.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms rambling, 60–120 cm long, wiry. Leaf-sheath auricles absent. Ligule an eciliate membrane. Leaf-blades lanceolate, tapering towards tip, 3–18 cm long, 3–8 mm wide. Leaf-blade apex acuminate.

Inflorescence. Synflorescence compound, linear.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Racemes 2(–3), paired, bilateral (as to sterile spikelets), 4–5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes clavate. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, clavate, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 5–5.5 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous or mucronate. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5.5–6.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface concave. Upper glume linear, chartaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 9–12 mm long overall, with twisted column. Column of lemma awn glabrous.

Distribution (TDWG). Continent. Africa.

Country /Province /State. East Tropical Africa. Kenya, Tanzania.

Andropogon huillensis Rendle. *Cat. Welw. Afr. Pl.* 2: 146. (1899).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Angola. **Basionym or Replaced Name:** *Andropogon laxatus* Stapf, Prain, *Fl. Trop. Afr.* 9 : 237 (1919). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Angola: Huilla: rather poor wooded meadows at Humptat, Apr 1860, *Welwitsch 2670* (K iso)

Illustrations (Books): R.M.Phill, F.T.E.A., *Gramineae* 3(1982):769, Fig. 180 as *A. laxatus*).

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Huilla, Angola.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–200 cm long. Ligule an eciliate membrane. Leaf-blades conduplicate, 5–30 cm long, 2–3 mm wide. Leaf-blade apex abruptly acute.

Inflorescence. Synflorescence compound, scanty or linear, open.

Inflorescence composed of racemes, terminal or terminal and axillary, subtended by a spatheole. Spatheole linear, 5–9 cm long. Racemes 2–6, paired or digitate, sinuous, 2–6 cm long. Rhachis fragile at the nodes, plumose on margins. Rhachis hairs 2–16 mm long. Rhachis internodes filiform, 4–5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets ascending, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, curved, 4–5 mm long, plumose, with 2–6 mm long hairs.

Sterile Spikelets. Companion sterile spikelets rudimentary, linear or lanceolate, 0–2.5 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous or awned, one glume awned, with 0–3 mm long awn.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the

lower floret male or barren, the upper fertile. Spikelets linear or lanceolate, dorsally compressed, 4–7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear or lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear or lanceolate, membranous, 1-keeled. Upper glume mucous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 0–2 -veined, without midvein, without lateral veins or obscurely veined, ciliate on margins. Fertile lemma lanceolate or oblong, hyaline, without keel. Lemma margins ciliate. Lemma apex lobed, 2 -fid, incised 0.25–0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, flexuous or geniculate, 8–20 mm long overall, without a column or with a straight or slightly twisted column. Column of lemma awn glabrous. Palea present or absent or minute, oblong.

Flower and Fruit. Anthers 3, 1.5 mm long.

n = 40 (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa, Western Indian Ocean. Cameroon, DRC. Ethiopia (inc. Eritrea). Kenya, Tanzania, Uganda. Angola, Malawi, Mozambique, Zambia, Zimbabwe. Botswana, Limpopo, North-West, Gauteng, Mpumalanga, Swaziland, Kwazulu-Natal. Madagascar.

Andropogon humbertii A. Camus. *Bull. Soc. Bot. France* 74: 631 (1928).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *H. Humbert* 3922, 27 Nov 1924–8 Dec 1924, Madagascar (US-2236445, US-1271917).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Jean Henri Humbert (1887–1967) French botanist who collected in Madagascar.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, 40–50 cm long. Lateral branches fastigiate. Leaf-sheaths glabrous on surface. Ligule a ciliate membrane. Leaf-blades 4–9 cm long, 3–5 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 2–4, paired or digitate, 3–4.5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, ciliate.

Sterile Spikelets. Basal sterile spikelets well-developed, 2–4 in number (on lowest raceme).

Companion sterile spikelets well-developed, male, lanceolate, 6 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus square, 0.5 mm long, pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally, winged on keel, winged narrowly, winged above. Lower glume intercarinal veins distinct, 4–6 in number. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume awned, 1 -awned.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, ciliate on margins. Fertile lemma lanceolate, 3 mm long, hyaline, without keel, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 9–10 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3, 3 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms 100–150 cm long. Leaf-sheaths pubescent. Ligule an eciliate membrane. Leaf-blades 30–60 cm long, 4–5 mm wide. Leaf-blade surface pubescent.

Inflorescence. Inflorescence a panicle with branches tipped by a raceme or composed of racemes, terminal and axillary. Panicle axis 0–5 cm long. Racemes 6–15, digitate or borne along a central axis, 2–4 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 3 mm long. Rhachis internodes linear, 3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 2.5 mm long, ciliate, with 3–4 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 5 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, 2 mm long, hyaline, without keel. Lemma apex lobed, 2-fid, incised 0.25 of lemma length, awned, 1-awned. Principal lemma awn from a sinus, geniculate, 6 mm long overall, with a straight or slightly twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

Andropogon ibityensis A. Camus. *Not. Syst.* 14 : 213 (1952).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madagascar, Mt. Ibity: Perrier 10768.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. from Mt Ibity, Madagascar.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 60–70 cm long. Leaf-sheaths keeled. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane. Leaf-blades 15–25 cm

long, 3–5 mm wide, stiff. Leaf-blade surface glabrous. Leaf-blade margins scaberulous. Leaf-blade apex acuminate.

Inflorescence. Synflorescence simple.

Inflorescence composed of racemes. Racemes 4–9, digitate, 1.5–5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes filiform, 3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 4 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, acuminate. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 4.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface concave. Lower glume apex acuminate. Upper glume lanceolate, chartaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma oblong, 3 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 9–11 mm long overall, with twisted column. Column of lemma awn glabrous.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Andropogon imerinensis Bosser. *Adansonia* n. s., 8: 521 (1968).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Madagascar, Tananarive: *Bosser 7697* (P holotype).

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (269, Fig. 98).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Imerin, Madagascar.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, slender, 20–70 cm long, 2–3 -noded. Culm-nodes glabrous. Lateral branches lacking or sparse. Leaves mostly basal. Ligule an eciliate membrane, 0.2–0.5 mm long, truncate. Leaf-blades filiform, conduplicate, 5–25 cm long, 0.8–1.4 mm wide. Leaf-blade surface glabrous or pilose. Leaf-blade apex filiform.

Inflorescence. Inflorescence composed of racemes. Racemes 2–3, paired or digitate, 2–5 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis hairs 1.5–2.5 mm long. Rhachis internodes filiform, 2–4.5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, villous.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 4–5 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate or oblong, dorsally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, 2-keeled, keeled laterally, 4–6 -veined. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled, 3–5 -veined. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 4–4.5 mm long, hyaline, 0–3 -veined, without midvein or with evident midvein, without lateral veins or distinctly veined, ciliate on margins, fringed above. Fertile lemma lanceolate, 4 mm long, hyaline, without

keel, 1–3 -veined, 0–3 -veined. Lemma margins ciliolate. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8–10 mm long overall, with twisted column. Column of lemma awn glabrous. Palea 1 mm long.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Andropogon indetonsus Sohns. *Mem. New York Bot. Gard.* 9(3): 269 (1957).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *B. Maguire & C.K. Maguire 40148*, 4 Dec 1954, Brazil Rio Branco: (US-2182180; IT: NY-169529).

Illustrations (Journals): *Revista Brasil. Bot.* (29): 297, Fig.19 (2006)).

Derivation (Clifford & Bostock 2007): *L.* unshorn. Pedicels of reduced spikelets densely hairy.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 100–200 cm long. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface. Ligule an eciliate membrane, 1.8–2 mm long. Leaf-blades 30–40 cm long, 10–15 mm wide. Leaf-blade surface glabrous, hairless except near base. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Synflorescence compound, linear, 30 cm long.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Racemes 2–3, paired or digitate, straight or arcuate, 2.5–8 cm long. Rhachis fragile at the nodes, scabrous on surface, glabrous on surface or pilose on surface, villous on margins. Rhachis internodes clavate, 3–5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 3–3.5 mm long.

Sterile Spikelets. Companion sterile spikelets well-developed, male, elliptic, 3.5–5 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous. Companion sterile spikelet lemmas enclosed by glumes, 3–3.5 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4.5–5.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally, 6 -veined. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume primary vein scabrous. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 4 mm long, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma lanceolate, 3–3.5 mm long, hyaline, without keel, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–15 mm long overall, with a straight or slightly twisted column. Column of lemma awn glabrous. Palea 1.5 mm long, hyaline, 0 -veined.

Flower and Fruit. Lodicules 2, 0.5–0.8 mm long. Anthers 3, 2–2.2 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil North.

Acre.

Andropogon incomptus W. D. Clayton. *Kew Bull.* 17: 467 (1964).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Guinea. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Guinea, Madina Tossekre: *Adam 12528* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L.* unadorned. Anthoecial surface dull rather than glossy.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Basal innovations flabellate. Culms erect, 250 cm long. Ligule a ciliolate membrane. Leaf-blades flat or conduplicate, 10–25 cm long, 2–4 mm wide, stiff.

Inflorescence. Synflorescence compound, paniculate, 40–60 cm long, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole linear, 1–1.5 cm long, herbaceous. Peduncle pubescent above. Racemes 1, single, 1 cm long. Rhachis fragile at the nodes, subterete, ciliate on margins. Rhachis internodes linear, 1–1.5 mm long. Rhachis internode tip transverse, flat, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 1–1.5 mm long, ciliate, tip rectangular.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 4–5 mm long, longer than fertile, persistent. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4.3 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus oblong, 0.8 mm long, bearded, base truncate, attached transversely. Spikelet callus hairs 0.25 length of spikelet.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled above. Lower glume primary vein scaberulous. Lower glume intercarinal veins absent. Lower glume surface flat. Lower glume apex acute. Upper glume lanceolate, coriaceous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume margins ciliolate. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 2 mm long, 0.5 length of spikelet, hyaline, 2 -veined. Fertile lemma linear, 2 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, incised 0.4 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 7 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3, 2 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Guinea.

Andropogon ingratus Hack. *Oesterr. Bot. Z.* 51(5): 151. 1901.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *A.F.M. Glaziou 18681*, 1891, Brazil; Minas Gerais (W; IT: US-75689 (fragm. ex W), W). LT designated by Zanin & Longhi-Wagner, *Novon* 15: 250 (2005).

Illustrations (Journals): *Novon* (13: 369 Fig 3 (2003) as var. *hirsutus*), *Revista Brasil. Bot.* (29: 297, Fig.20 (2006)).

Derivation (Clifford & Bostock 2007): L. disagreeable. The sharp callus enables the spikelets to catch on to clothing.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms erect, slender, 70–100 cm long. Lateral branches sparse. Ligule an eciliate membrane. Leaf-blades 14–35 cm long, 2–3 mm wide. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence composed of racemes. Racemes 2–3, paired or digitate, 5–6 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis internodes linear. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, villous.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas, linear or lanceolate, 5 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, scaberulous, glabrous, acute, muticous. Companion sterile spikelet lemmas 3.5 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave, asperulous. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2-fid, incised 0.33 of lemma length, muticous or awned, 1-awned. Principal lemma awn from a sinus, geniculate, 8–12 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast, Brazil Southeast.
Minas Gerais.

Andropogon insolitus Sohns. *Mem. N. Y. Bot. Gard.* 9: 271 (1957).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *B. Maguire & J.J. Wurdack 35777*, 2 May 1953, Venezuela: Bolmvar: abundant in morichal 2 km SSW of Ciudad Piar, 300 m (US-2116112; IT: NY-169528; MO-3326787 (fragm. ex US)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. uncommon. The species is geographically restricted although locally abundant.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 25–50 cm long. Leaves mostly basal. Leaf-sheaths keeled, glabrous on surface. Ligule an eciliate membrane, 1 mm long. Leaf-blades 10–25 cm long, 1.5–2.5 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous, tuberculate-ciliate, hairy at base.

Inflorescence. Synflorescence compound, linear, 6–10 cm long.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, enclosed. Spatheole lanceolate, 2–2.5 cm long. Racemes 2–4, paired or digitate, 1.5–2 cm long. Rhachis fragile at the nodes, pubescent on surface, ciliate on margins. Rhachis internodes linear. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 1.7–2.2 mm long, ciliate, with 1.5–3 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas or male, lanceolate, 3–4.7 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4–4.8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface flat or concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret linear, hyaline. Fertile lemma lanceolate, hyaline, without keel, 0-veined, 0–3-veined, without veins. Lemma apex entire, muticous.

Flower and Fruit. Anthers 3, 0.9–1.1 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Brazil. Venezuela.

Andropogon itremoensis Voronts. *Kew Bull.* 68: 7 (2013).

Illustrations: None found.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Andropogon ivohibensis A. Camus. *Bull. Soc. Bot. France* 71: 922 (1924).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Madagascar, Ambohimaroa: *Perrier 10820* ; Madagascar, Ivohibe: *Perrier 11170* .

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (267, Fig. 97).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Pie d'Ivohibi, Madagascar.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–60 cm long. Lateral branches sparse. Leaf-sheaths keeled, glabrous on surface. Ligule a ciliolate membrane, 0.5 mm long, truncate. Leaf-blades 20–30 cm long, 1.5–2 mm wide, stiff. Leaf-blade surface scabrous, rough on both sides, glabrous. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 3, digitate, 3.5–6 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis hairs 2 mm long. Rhachis internodes linear, 2.5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 2.5 mm long, villous.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 5 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute. Companion sterile spikelet lemmas dentate, 1-awned, with 3–4 mm long awn.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus square, 0.5 mm long, pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, 2-keeled, keeled dorsally. Lower glume intercarinal veins absent. Lower glume surface concave. Lower glume margins ciliolate. Upper glume lanceolate, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 5 mm long, hyaline, ciliate on margins. Fertile lemma lanceolate, 4.5 mm long, hyaline, without keel, 0–3 -veined. Lemma margins ciliate. Lemma apex lobed, 2 -fid, incised 0.33 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8–12 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Andropogon ivorensis Adjan. & W. D. Clayton. *Adansonia, n. s.*, 3: 401. (1963).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Ivory Coast. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Ivory Coast, Kongasso: *Adjanohoun 388a* (K holo, ABI).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Ivory Coast, in particular from Togo.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms 150–200 cm long, 2–4 mm diam. Leaf-sheaths glabrous on surface, outer margin hairy. Ligule a ciliolate membrane, 0.5 mm long. Leaf-blades 40–70 cm long, 6–12 mm wide. Leaf-blade surface glabrous or pubescent, hairy on both sides. Leaf-blade margins scaberulous. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes 2, paired, unilateral (as to sterile spikelets), 9–11 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes columnar, 6 mm long. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets squeezed between internode and pedicel, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, clavate, 5 mm long, ciliate, tip widened.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 12 mm long, longer than fertile. Companion sterile spikelet glumes chartaceous, keeled, 19 -veined, acute, muticous. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus square, 1 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled above, keeled dorsally, keeled obtusely. Lower glume lateral veins several in each keel (5–6). Lower glume surface deeply depressed. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 7 mm long, hyaline, 2 -veined, obtuse. Fertile lemma lanceolate, 4.5 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.33 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 40 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Lodicules 2, cuneate, 1 mm long, fleshy, truncate. Anthers 3, 3.4 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa. Ivory Coast, Mali, Togo.

Andropogon kelleri Hack. ex Schinz. *Mem. Herb. Boiss.* no. 20. 6. (1900).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Somalia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Somalia, Ogaden steppe: *Keller 129* (Z syn); Somalia, Tujus steppe: *Keller 156* (Z syn, K).

Illustrations (Books): T.A.Cope, in M.Thulin, *Poaceae* (Gramineae). *Flora of Somalia* (1995) (260, Fig. 153).

Derivation (Clifford & Bostock 2007): in honor of A. Keller (1873–1945) Swiss botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms geniculately ascending or decumbent, 15–40 cm long. Lateral branches suffrutescent. Leaf-sheaths glabrous on surface. Ligule a ciliolate membrane. Leaf-blades 2–7 cm long, 1–2 mm wide. Leaf-blade surface glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 2–3 cm long. Racemes 1, single, 2–3 cm long. Rhachis fragile at the nodes, semiterete, villous on surface, villous on margins. Rhachis hairs 3–6 mm long. Rhachis internodes linear, 3–3.5 mm long. Rhachis internode tip crateriform. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, villous.

Sterile Spikelets. Companion sterile spikelets well-developed, male, linear, dorsally compressed, 3–4 mm long, shorter than fertile, deciduous with the fertile. Companion sterile spikelet glumes chartaceous, 6–7 -veined, glabrous, acuminate. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic, 1 length of spikelet, chartaceous, much thinner above, 2-keeled, keeled dorsally, wingless. Lower glume primary vein scaberulous. Lower glume intercarinal veins absent. Lower glume surface concave. Lower glume margins ciliate. Lower glume apex emarginate or obtuse. Upper glume lanceolate, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume margins ciliate. Upper glume apex acute, mucronate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret linear, 4 mm long, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel, 3 -veined, 0–3 -veined. Lemma margins ciliate. Lemma apex lobed, 2 -fid, incised 0.25 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 14–16 mm long overall, with twisted column. Column of lemma awn 8–10 mm long, glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3, 2 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Ethiopia (inc. Eritrea), Somalia.

Andropogon lacunosus J. G. Anders. *Bothalia* 8: 113 (1962).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: South Africa, Ermelo: *Gericke A49* (PRE holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. lacuna*, cavity; *-osus*, well developed. Lower glume pitted.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms rambling, 30–60 cm long, wiry. Ligule an eciliate membrane. Leaf-blades 8–15 cm long, 2–5 mm wide.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes 2–3, paired or digitate, 3–6 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 7–8 mm long, longer than fertile, persistent. Companion sterile spikelet glumes chartaceous, 3 -veined (raised), lacunose, glabrous, acuminate, muticous. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5–7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus square or oblong, 0.7 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally, winged on keel, winged narrowly. Lower glume intercarinal veins distinct. Lower glume surface convex or with a longitudinal median groove, lacunose (2 or more pits). Lower glume apex acuminate. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume awned, 1 -awned, awn 1–2 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.25 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8–14 mm long overall, with twisted column. Column of lemma awn glabrous. Palea hyaline, 0 -veined, without keels.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa. Cameroon. Tanzania. Angola, Zimbabwe. Mpumalanga, Swaziland.

Andropogon lateralis Nees. *Agrost. Bras.* 2: 329. (1829).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *F. Sellow s.n.*, no date, Brazil (B; IT: US-925158 (fragm.)).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (498), S.A.Renvoize, *Gramineas de Bolivia* (1998) (586, Fig. 137), S.A.Renvoize, *The Grasses of Bahia*, 1984 (280, Fig. 107), E.G.Nicora, *Los Generos de Gramineas de America Austral* (1987) (517, Fig. 185), L.B. Smith, D.C. Wasshausen, R.M. Illustrations (Journals): *Ruizia* (13:442 Fig 59f (1993)), *Revista Brasil. Bot.* (29: 297, Fig.21 (2006)).

Derivation (Clifford & Bostock 2007): *laterus*, side; *-ale*, pertaining to. Inflorescence forming as a lateral shoot.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations intravaginal. Culms 70–150 cm long. Culm-nodes glabrous. Leaf-sheaths 5–16 cm long, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 1–2.3 mm long, truncate. Leaf-blades 7–34 cm long, 2–4 mm wide. Leaf-blade surface puberulous, sparsely hairy, hairy adaxially. Leaf-blade margins scabrous. Leaf-blade apex acute.

Inflorescence. Synflorescence compound, linear.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Racemes 2–6, digitate, 2.5–7.5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs on upper part of internode, 0.5–4 mm long. Rhachis internodes linear, 3.5–4 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, ciliate, with 0.5–4 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 4.5–8 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3.5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume primary vein scaberulous. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, 2–4 mm long, hyaline, without keel, 1 -veined, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 5.5–11 mm long overall, with a straight or slightly twisted column. Column of lemma awn 0.5–1.5 mm long, glabrous.

Flower and Fruit. Anthers 3, 0.5–1.3 mm long. Caryopsis 2.5 mm long.

Andropogon lehmannii Pilger. *Engl. Jahrb.* 27: 24. (1899).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: F.C. Lehmann 6979, no date, Colombia: near Popoyan (B; IT: US-75595).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): as for *Paspalum lehmanniana*.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Basal innovations extravaginal. Culms 80–300 cm long. Lateral branches sparse. Leaf-sheaths glabrous on surface. Ligule a ciliolate membrane, truncate. Leaf-blades 20–40 cm long, 5–10 mm wide. Leaf-blade margins scabrous.

Inflorescence. Synflorescence compound, paniculate.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 5–7 cm long. Racemes 2, paired, 4–6 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis hairs 4 mm long. Rhachis internodes filiform, 3.5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 4 mm long, villous, with 4 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 6–7 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, 7 -veined, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, 4 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 7–12 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Andropogon leprodes T.A. Cope. *Kew Bull.* 50(1): 111 (1995).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online, U. Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Somalia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Somalia, Sanaag: *Hemming & Watson 3286* (K holo).

Illustrations (Books): T.A. Cope, in M. Thulin, *Poaceae* (Gramineae). *Flora of Somalia* (1995).

Illustrations (Journals): *Kew Bulletin* (50: 110, Fig. 1 (1995)).

Derivation (Clifford & Bostock 2007): Gk. *leprodes*, rough. Lower glumes of sessile spikelet densely scabrid.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Culms 25–50 cm long. Lateral branches lacking. Ligule an eciliate membrane. Leaf-blades flat, 2–7 cm long, 1–2 mm wide, glaucous.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes 2–4, paired or digitate, 4–6 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs white. Rhachis internodes filiform or linear. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform or linear, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 4–7 mm long, shorter than fertile, persistent. Companion sterile spikelet glumes chartaceous, glabrous, acute or acuminate, muticous. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate or elliptic, dorsally compressed, 6.5–9

mm long, falling entire, deciduous with accessory branch structures. Spikelet callus square, 1 mm long, pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate or elliptic, 1 length of spikelet, herbaceous, much thinner above, 2-keeled, keeled laterally. Lower glume lateral veins ribbed, intercarinal veins distinct, intercarinal veins 5–7 in number. Lower glume surface convex or with a longitudinal median groove, scabrous. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, chartaceous, 1-keeled. Upper glume apex acuminate, awned, 1 -awned, awn 1–1.5 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–20 mm long overall, with twisted column. Column of lemma awn glabrous. Palea hyaline, 0 -veined.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Somalia.

Andropogon leucostachyus H. B. & K. *Nov. Gen. et Sp.* 1: 187. (1815).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Humboldt & Bonpland s.n.*, Sep, Venezuela: between Caripe and Cumana (P; IT: B-W-18654, BM, P).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (498), S.A.Renvoize, *Gramineas de Bolivia* (1998) (592, Fig. 140), S.A.Renvoize, *The Grasses of Bahia*, 1984, J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (22, Fig. 6), L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (1285, Fig. 251 & 254).

Illustrations (Journals): *Ruizia* (13:442 Fig 59d-e (1993)), *Revista Brasil. Bot.* (29: 297, Fig.22 (2006)).

Derivation (Clifford & Bostock 2007): Gk. *leukos*, white; *stachys*, ear of corn. The spikelets are white and sometimes invested with copious white hairs.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 40–110 cm long, 0.7–2 mm diam. Culm-internodes solid. Culm-nodes glabrous. Lateral branches sparse. Leaves mostly basal. Leaf-sheaths keeled, glabrous on surface. Ligule a ciliolate membrane, 0.7–1.7 mm long. Leaf-blades flat or conduplicate, 15–32 cm long, 1.5–2.5 mm wide. Leaf-blade apex acuminate.

Inflorescence. Synflorescence compound, scanty.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Racemes 2–4, paired or digitate, 2–5.5 cm long. Rhachis fragile at the nodes, plumose on surface, plumose on margins. Rhachis hairs lengthening towards internode tip, 5–10 mm long. Rhachis internodes linear, 1.8–2.7 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 2.5–3.5 mm long, plumose, with 5–10 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, linear, 1.1–1.5 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 2–3.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base obtuse, inserted. Spikelet callus hairs 4–5 mm long.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 1.8–2.6 mm long, hyaline, 2 -veined, ciliate on margins, fringed above. Fertile lemma lanceolate, 1.5–2.5

mm long, hyaline, without keel. Lemma apex entire, acuminate, muticous or mucronate. Palea absent or minute.

Flower and Fruit. Anthers 3.

Andropogon liebmannii Hack. *Flora* 68: 132. (1885).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mexico, Chinantla: *Liebmann 77* (C lecto, MICH, UC, US).

Recent Synonyms: *Andropogon mohrii* Hack., *Flora*, 68: 132. (1885).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (658).

Derivation (Clifford & Bostock 2007): in honor of Frederik Michael Leibmann (1813–56), Danish botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–100 cm long. Lateral branches sparse. Leaf-sheaths glabrous on surface or pilose. Ligule an eciliate membrane, 0.5–1 mm long, brown. Leaf-blades 10–30 cm long, 2–6 mm wide. Leaf-blade surface glabrous or pilose.

Inflorescence. Inflorescence composed of racemes. Peduncle glabrous. Racemes 4–5, digitate, 2–4 cm long, bearing 5–10 fertile spikelets on each. Rhachis fragile at the nodes, plumose on margins. Rhachis hairs 6–8 mm long. Rhachis internodes filiform, 3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 3–4 mm long, plumose, with 6–8 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, comprising 2 subequal glumes without lemmas, linear, 1–2 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, acute.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3.5–4 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, cartilaginous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 13–17 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 1.

$n = 10$ (1 ref TROPICOS).

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA, Mexico. Alabama, Georgia, Louisiana, North Carolina, South Carolina. Central Mexico, Northeast Mexico, Gulf (Mexico), Southwest Mexico.

Mexico State, Puebla. Hidalgo, Queretaro. Veracruz. Jalisco, Michoacan, Nayarit, Oaxaca.

Andropogon ligulatus (Stapf) W.D. Clayton. *Kew Bull.* 32(1): 2 (1977).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online, U. Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Zimbabwe. **Basionym or Replaced Name:** *Andropogon laxatus* var. *ligulatus* Stapf, *Fl. Trop. Afr.* 9:238 (1919). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mozambique Distr. Rhodesia: Mashonaland, Charter Distr., *Mundy s.n.* (HT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. ligula*, small tongue; *-ata*, possessing. Origin uncertain.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–100 cm long. Ligule an eciliate membrane, 1.5–3 mm long. Leaf-blades 10–25 cm long, 1–2 mm wide. Leaf-blade apex attenuate.

Inflorescence. Synflorescence simple or compound, scanty, open.

Inflorescence composed of racemes, terminal and axillary or terminal, subtended by a spatheole. Spatheole linear, 5–8 cm long. Racemes 2(–4), paired, sinuous, 4–9 cm long. Rhachis fragile at the nodes, villous on margins or plumose on margins. Rhachis hairs 2–5 mm long. Spikelet packing lax. Rhachis internodes filiform. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets ascending, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, curved, villous or plumose, with 2–5 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, comprising 2 subequal glumes without lemmas or containing empty lemmas, lanceolate, dorsally compressed, 5–7 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, acute, muticous or awned, one glume awned, with 0–1 mm long awn. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5.5–7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus cuneate, 1 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent or obscure, 0–2 in number. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled. Upper glume muticous or awned, awn 0–1 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.33–0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–15 mm long overall, with twisted column. Column of lemma awn glabrous. Palea oblong.

Distribution (TDWG). Continent. Africa.

Country /Province /State. East Tropical Africa, South Tropical Africa. Tanzania. Malawi, Mozambique, Zambia.

Andropogon lima (Hack.) Stapf. Prain, *Fl. Trop. Afr.* 9: 217 (1918).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online.

TYPE from Cameroon. **Basionym or Replaced Name:** *Andropogon amethystinus* var. *lima* Hack., DC., *Monogr. Phan.* 6:464 (1889). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Mann 2084*, Dec 1862, Cameroon: mountains 2700 m (W; IT: K, US-1037914 (ex K)).

Illustrations (Books): S. Phillips, *Poaceae* (Gramineae) in I. Hedberg & S. Edwards, *Flora of Ethiopia and Eritrea* (1995) (323, Fig. 130).

Derivation (Clifford & Bostock 2007): *L. lima*, file. Leaves or glumes scabrid.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Butt sheaths glabrous. Culms 45–100 cm long. Ligule an eciliate membrane. Leaf-blades erect, 15–50 cm long, 2 mm wide, stiff. Leaf-blade midrib widened (0.33 width of blade). Leaf-blade surface scabrous. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes 2(–5), paired, 6–14 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes filiform or linear. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform or linear, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, linear or lanceolate, dorsally compressed, 4.5–8 mm long, shorter than fertile, persistent. Companion sterile spikelet glumes chartaceous, glabrous, acute, awned, one glume awned, with 0.5–3 mm long awn. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 6.5–8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus cuneate, 1 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally, winged on keel, winged narrowly. Lower glume intercarinal veins distinct, 2–5 in number. Lower glume surface flat or concave. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume awned, 1 -awned, awn 2–4 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5–0.6 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8–20 mm long overall, with twisted column. Column of lemma awn glabrous. Palea hyaline, 0 -veined, without keels.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa. Cameroon, Rwanda. Ethiopia (inc. Eritrea), Sudan. Kenya, Tanzania, Uganda. Malawi.

Andropogon lindmanii Hack. ex Lindm. *Svensk. Vet.-Akad. Handl.* 4 no. 6. 6. (1900).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Hab. in Brasilia australi, Rio Grande do Sul, Quinta prope oppidum Sco Pedro do Ri Grande, locis arena mobili obtectis, mens Dec. florens, *Exp. I. Regnell, A. 855 [Lindmann coll.]* (HT: S).

Illustrations (Books): B.Rosengurt, *Gramineas Uruguayas I* (1970) (160, Fig. 62).

Illustrations (Journals): *Revista Brasil. Bot.* (29: 297, Fig.23 (2006)).

Derivation (Clifford & Bostock 2007): in honor of Carl Axel Magnus Lindman (1856–1928) Swedish botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations intravaginal. Culms erect, 40–100 cm long. Culm-nodes glabrous. Leaf-sheaths 5–10 cm long, glabrous on surface. Ligule an eciliate membrane, 1.4 mm long, scarious. Leaf-blades 3–30 cm long, 2–4 mm wide. Leaf-blade surface scaberulous, rough adaxially, glabrous. Leaf-blade apex acute.

Inflorescence. Synflorescence compound, linear.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole lanceolate, 6.5–8 cm long. Racemes 2–3, paired or digitate, 2.5–7 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis hairs 7–8 mm long. Rhachis internodes filiform, 0.66 length of fertile spikelet. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 0.75 length of fertile spikelet, villous, with 7–8 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 4.8–6 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3.8–4.6 mm long,

falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted. Spikelet callus hairs 2.5 mm long.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, 1.6–2.8 mm long, hyaline, without keel, 1 -veined, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 5.5–9 mm long overall, with a straight or slightly twisted column. Column of lemma awn 0.5–1.2 mm long, glabrous.

Flower and Fruit. Anthers 3, 0.8–0.9 mm long. Caryopsis 2.4 mm long, dark brown.
 $n = 30$ (1 ref TROPICOS).

Distribution (TDWG). Continent. South America.

Illustrations (Books): K.M.Matthew, *Flora Palni Hills* (1996) (780, Pl. 780).

Derivation (Clifford & Bostock 2007): *L. leaden*. Spikelets grey or purple.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations flabellate. Culms 25–90 cm long. Leaf-sheath auricles erect, 2–6 mm long. Ligule an eciliate membrane, 2–6 mm long. Leaf-blades erect, 7–20 cm long, 2–4 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence composed of racemes, terminal or terminal and axillary. Racemes 2(–4), paired, 2–5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes clavate. Rhachis internode tip transverse, cupuliform, with scarious rim. Raceme-bases brief, unequal (the longer measured), 3–5 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 6–7 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, acute, muticous. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or oblong, dorsally compressed, 6–8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally, winged on keel, winged narrowly, winged near apex. Lower glume intercarinal veins distinct, 3–7 in number. Lower glume surface flat or concave. Upper glume lanceolate, chartaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 9–13 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. $n = 10$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India, Sri Lanka. Tamilnadu.

Andropogon longiberbis Hack. *Flora* 68: 131. (1885).

TYPE from USA. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: LT: *A.P. Garber 1877*, 1877, USA: Florida (W; ILT: MO, NY, US-75610 (fragm.), W, W). LT designated by Campbell, J. *Arnold Arbor*. 64: 223 (1983).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 25 Poaceae*, part 2 (2003) (662).

Derivation (Clifford & Bostock 2007): *L. longus*, long; *barba*, beard.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–100 cm long. Lateral branches ample. Leaf-sheaths hirsute. Ligule an eciliate membrane. Leaf-blades 25–50 cm long, 3–7 mm wide. Leaf-blade surface scabrous, rough adaxially, hirsute, hairy abaxially.

Inflorescence. Synflorescence compound, paniculate.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, enclosed. Spatheole lanceolate, 3–5 cm long, brown. Racemes 2(–4), paired, 3–4 cm long. Rhachis fragile at the nodes, plumose on margins. Rhachis hairs 8–10 mm long. Rhachis internodes linear, 2 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 4 mm long, plumose, with 8–10 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels or represented by single glumes, linear, 0–1 mm long, shorter than fertile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4–4.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, cartilaginous, 2-keeled, keeled laterally. Lower glume primary vein ciliolate. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight, 12–16 mm long overall.

Flower and Fruit. Anthers 1.

n = 10 (1 ref TROPICOS).

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Southeastern USA. Florida, South Carolina. **Caribbean.** Bahamas.

Andropogon macrophyllus Stapf. Prain, *Fl. Trop. Afr.* 9: 264 (1918).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Nigeria. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *W. MacGregor 248*, Feb 1902, Nigeria: Lagos (K; IT: US-1037904).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *Gk. makros*, large; *phyllon*, leaf. Leaf-blades large.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms robust, 200–350 cm long, 6–12 mm diam. Leaf-sheaths outer margin hairy. Ligule a ciliolate membrane, 2–4 mm long. Collar without external ligule. Leaf-blade base tapering to the midrib. Leaf-blades 40–75 cm long, 20–40 mm wide. Leaf-blade apex attenuate.

Inflorescence. Synflorescence compound, paniculate, 60–120 cm long, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole lanceolate, 6–10 cm long, scarious or herbaceous. Racemes 2, paired, 4–7 cm long. Rhachis fragile at the

nodes, glabrous on surface or pubescent on surface, ciliate on margins. Rhachis hairs 2 mm long. Rhachis internodes clavate, 4 mm long. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, clavate, 4 mm long, ciliate, tip lobed (bilobed).

Sterile Spikelets. Companion sterile spikelets well-developed, male, oblong, dorsally compressed, 4–5 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, acute, mucronate. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, chartaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins distinct, 8–10 in number. Lower glume surface flat or with a longitudinal median groove. Upper glume lanceolate, membranous, 1-keeled, 3 -veined. Upper glume surface puberulous. Upper glume margins ciliate. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 5 mm long, hyaline, 2 -veined, ciliate on margins. Fertile lemma oblong, hyaline, without keel, 1 -veined, 0–3 -veined. Lemma apex lobed, 2 -fid, incised 0.33 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 9–16 mm long overall, with twisted column. Column of lemma awn glabrous. Palea oblong.

Flower and Fruit. Anthers 3, 4–5 mm long.

Distribution (TDWG). Continent. Africa.

Flower and Fruit. $n = 30$ (1 ref TROPICOS). $2n = 20$ (2 refs TROPICOS).

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil, Southern South America. Bolivia. Brazil West Central, Brazil Southeast, Brazil South. Paraguay, Uruguay.

Distrito Federal, Goiás. Espirito Santo, Minas Gerais, Sao Paulo. Paraná, Rio Grande do Sul, Santa Catarina. Corrientes, Misiones.

Andropogon mannii Hook. f. *Journ. Linn. Soc.* 7: 232. (1864).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Fernando Po. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Fernando Po: Mann 1475 (K syn);.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Gustav Mann (1836–1916) German botanist and plant collector employed as gardener at Royal Botanic Gardens, Kew, England.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths papery or coriaceous, glabrous. Basal innovations flabellate. Culms 10–60 cm long. Ligule an eciliate membrane. Leaf-blades erect, conduplicate, 2–25 cm long, 2–8 mm wide, stiff.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes (2–)3–10, digitate, 2–7 cm long. Central inflorescence axis 0–3 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs white, 0.5–1 mm long. Rhachis internodes filiform or linear, 3–5 mm long. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform or linear, 3–5 mm long, ciliate, with white hairs, with 0.5–1 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 5–8 mm long, as long as fertile, persistent. Companion sterile spikelet glumes chartaceous, glabrous, acute, mucicous or mucronate. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4.5–8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus square, 0.5 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, cartilaginous, purple, 2-keeled, keeled laterally. Lower glume intercarinal veins absent or obscure, 0–4(–7) in number. Lower glume surface flat or concave, glabrous. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume mucicous or awned, 1 -awned, awn 0–5 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.25–0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 4–14 mm long overall, with twisted column. Column of lemma awn glabrous. Palea hyaline, 0 -veined, without keels.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa. Ivory Coast, Sierre Leone. Cameroon, Annobon, Principe & Sao Tome, Bioko. Sudan. Tanzania, Uganda. Malawi, Mozambique, Zambia, Zimbabwe. Limpopo, Mpumalanga, Swaziland.

Andropogon monocladus A.Zanin & Longhi-Wagner. *Novon* 13(3): 370 . (2003).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brasília: Reserva Ecológica do IBGE, 4 Aug 1979, *E.P. Heringer et al. 1716*, Brazil (Bahia, Distrito Federal) HT: IBGE; IT: CEN, ICN, SP, UEC

Illustrations (Journals): *Novon* (13: 371 Fig 2 (2003)), *Revista Brasil. Bot.* (29: 298, Fig.298 (2006)).

Derivation (Clifford & Bostock 2007): Gk *monos*, one; *klados*, a shoot. Culms with a solitary branch at each node.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 170–250 cm long, 9–10 -noded. Culm-internodes distally glabrous. Leaf-sheaths mostly shorter than adjacent culm internode, hirsute. Ligule a ciliolate membrane, 1–1.2 mm long, truncate. Leaf-blades 22–70 cm long, 5–7 mm wide. Leaf-blade surface glabrous or hirsute, hairy on both sides. Leaf-blade margins scabrous. Leaf-blade apex abruptly acute or acute.

Inflorescence. Synflorescence compound, linear.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 3.5–7 cm long. Peduncle 1.5–6.5 cm long. Racemes 1, single, 2.5–5 cm long. Rhachis fragile at the nodes,

ciliate on margins. Rhachis internodes linear, 2.2–3.5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 2.2–3.5 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 3–5.5 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4.5–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally, 2 -veined. Lower glume primary vein scaberulous. Lower glume intercarinal veins absent. Lower glume surface concave. Lower glume apex erose or dentate, 2 -fid. Upper glume linear, 3.5–4 mm long, coriaceous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume margins ciliate. Upper glume apex acuminate, muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3–4 mm long, hyaline, 2–3 -veined, ciliate on margins, fringed above. Fertile lemma lanceolate, 3–3.5 mm long, hyaline, without keel, 1–3 -veined, 0–3 -veined, one-veined or several-veined. Lemma apex lobed, 2 -fid, incised 0.2–0.33 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8–9 mm long overall, with a straight or slightly twisted column. Column of lemma awn glabrous. Palea 0.8–1.2 mm long, hyaline, 0 -veined, without keels. Palea apex erose.

Flower and Fruit. Lodicules 2, 0.8 mm long. Anthers 3, 0.6–1 mm long, yellow. Caryopsis 2–5 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central.

Distrito Federal, Goiás. Bahia.

Andropogon multiflorus S.A. Renvoize. *Gramineas de Bolivia*: 596 (1998).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Bolivia: La Paz: Iturralde, Luisita, *Haase 1* (HT: LPB; IT: K).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (589, Fig. 138).

Illustrations (Journals): *Revista Brasil. Bot.* (29: 298, Fig.28 (2006)).

Derivation (Clifford & Bostock 2007): *L. multus*, many; flos, flower. Spikelets with more florets than those of related species.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations flabellate. Culms erect, 160–190 cm long. Ligule an eciliate membrane. Leaf-blades flat or conduplicate, 28–30 cm long, 1.5–4 mm wide. Leaf-blade apex acute.

Inflorescence. Synflorescence compound, linear, 50 cm long.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Racemes 2–6, paired or digitate, 2.5–5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas or male, lanceolate, 3–4 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel. Lemma apex muticous.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia, Colombia.

Andropogon munroi C. B. Clarke. *Journ. Linn. Soc.* 25: 87 t. 37.[Feb.] (1889).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960) (& as *A. tristis*, *Cymbopogon hookeri*, *C. tibeticus*).

TYPE from India. **Basionym or Replaced Name:** *Cymbopogon munroi* (C.B. Clarke) H.J. Noltie, *Edinburgh J. Bot.*, 56(3): 400 (1999), *C. hookeri* (Munro ex Hack.) Stapf ex Bor, *Indian Forest Rec.*, n. s. Bot., 1 92 (1938). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Muneypore: Clarke 4197.

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (807, Fig. 806 as *Cymbopogon*), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 874).

Derivation (Clifford & Bostock 2007): in honor of William Munro (1818–1880) Scots-born British soldier and amateur botanist who collected extensively in India.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–150 cm long. Ligule an eciliate membrane. Leaf-blades 15–30 cm long, 3–7 mm wide. Leaf-blade surface glabrous or pubescent.

Inflorescence. Inflorescence composed of racemes, terminal or terminal and axillary. Racemes 2–4(–8), digitate, 2.5–7.5 cm long. Central inflorescence axis 0.3–1.5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear. Rhachis internode tip transverse, crateriform, with lobed rim. Raceme-bases brief or filiform, 4–8 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, elliptic or oblong, dorsally compressed, 4.5–6.5 mm long, as long as fertile, persistent. Companion sterile spikelet glumes chartaceous, muticous. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or oblong, dorsally compressed, 4.5–6.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic or oblong, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally or laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume lanceolate, chartaceous, 1-keeled.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8–15 mm long overall, with twisted column. Column of lemma awn glabrous.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, Tibet. **Indian Subcontinent.** Assam, Eastern Himalaya, India, Nepal, Pakistan, West Himalaya. Sichuan, Yunnan. Bhutan. Nagaland.

Andropogon nashianus Hitchcock. *Contrib. U. S. Nat. Herb.* 12: 193 (1909).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *C. Wright* 3899, 1865, Cuba (US-35320; IT: NY-71015 (possible)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating connection. In honor of George Valentine Nash (1864–1921) United States botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, culms solitary or caespitose. Culms 30–45 cm long. Lateral branches lacking. Leaf-sheaths glabrous on surface or pilose. Ligule an eciliate membrane. Leaf-blades 1–4 cm long, 1 mm wide.

Inflorescence. Inflorescence composed of racemes. Racemes 2, paired, 3–4 cm long. Rhachis fragile at the nodes, plumose on margins. Rhachis hairs 5–7 mm long. Rhachis internodes clavate, 2–3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 2–3 mm long, plumose, with 5–7 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, linear, 1–2 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 3–3.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled dorsally. Lower glume primary vein scabrous. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma lanceolate, hyaline, without keel, 1 -veined, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight, 10–15 mm long overall.

Flower and Fruit. Anthers 1.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba.

Andropogon perdignus Sohns. *Mem. N. Y. Bot. Gard.* 9 : 274 (1957).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Venezuela, Cerro Duida: Maguire, Cowan & Wurdack 29572 (US holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. per*, very; dignus, worthy. Worthy of recognition on several counts and especially the height of the culms.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 200–300 cm long. Culm-internodes glaucous. Culm-nodes glabrous. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface. Ligule an eciliate membrane, 2 mm long. Leaf-blades 20–45 cm long, 10–15 mm wide. Leaf-blade midrib prominent beneath. Leaf-blade surface glabrous.

Inflorescence. Synflorescence compound, linear, 25–35 cm long, open.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole lanceolate, 2–4 cm long. Racemes 1, single, 2–4 cm long. Rhachis fragile at the nodes, scabrous on surface, villous on margins. Rhachis internodes clavate, 3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, villous, hairy on margins.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 2.5–3 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally, 4 -veined. Lower glume primary vein scabrous, ciliolate. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled, 3 -veined. Upper glume primary vein pubescent (above). Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2-keeled, ciliolate on margins. Fertile lemma lanceolate, 3–3.7 mm long, hyaline, without keel, 0–

3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–20 mm long overall, with a straight or slightly twisted column. Column of lemma awn glabrous. Palea 2.5–3 mm long, hyaline, 2 -veined, 2-keeled.

Flower and Fruit. Lodicules 2, 0.5–0.7 mm long. Anthers 3, 1.5 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Andropogon perligulatus Stapf. *Kew Bull.* 1908. 410. (1908).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Togo. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Togo, Misahohe: *Baumann 318* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. per*, very; *ligulus*, tongue; *-atus*, possessing. Ligule prominent.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–150 cm long. Leaf-sheath oral hairs lacking. Leaf-sheath auricles erect, 3–12 mm long. Ligule an eciliate membrane. Leaf-blades 10–40 cm long, 1–5 mm wide.

Inflorescence. Synflorescence simple or compound, linear.

Inflorescence composed of racemes, terminal or terminal and axillary, subtended by an unspecialized leaf-sheath or a spatheole. Racemes 2, paired, bilateral (as to sterile spikelets), 3–8 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes cuneate. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 3.5–6 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, scaberulous, glabrous, acute, mucicous or mucronate. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 4–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface deeply depressed. Upper glume linear, chartaceous, 1-keeled. Upper glume mucicous or awned, 1 -awned, awn 0–3 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–20 mm long overall, with twisted column. Column of lemma awn glabrous.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa. Benin, Burkina, Ghana, Ivory Coast, Mali, Nigeria, Senegal, Sierre Leone, Togo. Central African Republic, DRC. Ethiopia (inc. Eritrea). Kenya, Tanzania, Uganda. Angola, Malawi, Zambia, Zimbabwe.

Andropogon pinguipes Stapf. *Kew Bull.* 1908. 411. (1908).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Senegal. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Senegambia: M'Bidjen, *Thierry 92* (HT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. pinguis*, fatty; *pes*, foot. Pedicels clavate and glossy on the back.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms 30–150 cm long. Leaf-sheath auricles absent or erect, 0–3 mm long. Ligule a ciliate membrane. Leaf-blade base tapering to the midrib. Leaf-blades 10–20 cm long, 3–5 mm wide. Leaf-blade surface pubescent, hairy abaxially. Leaf-blade margins scaberulous. Leaf-blade apex attenuate.

Inflorescence. Synflorescence compound, linear, 15–30 cm long.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole lanceolate, 6–8 cm long, scarious. Racemes 2, paired, 3–4.5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes oblong. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, inflated, 4 mm long, ciliate, tip lobed (bilobed).

Sterile Spikelets. Companion sterile spikelets well-developed, male, elliptic, dorsally compressed, 6–6.5 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, glabrous or pubescent, acute, awned, one glume awned, with 1–4 mm long awn. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins distinct, 7–8 in number. Lower glume surface flat or with a longitudinal median groove. Lower glume apex obtuse. Upper glume lanceolate, chartaceous, 1-keeled, 3 -veined. Upper glume margins ciliate. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined, ciliate on margins. Fertile lemma oblong, 3.5 mm long, hyaline, without keel. Lemma margins ciliate. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–22 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3, 3.5 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa. Senegal.

Andropogon platyphyllus Hack. *Monogr. Phan.* 6: 428–429 (1889).

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Karsten s.n.*, Colombia: Gatame prope Gagueza (W; IT: US).

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Andropogon pohlianus Hack. *Mart. Fl. Bras.* 2, 3:304. (1883).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: T: *J.B.E. Pohl 1541*, no date, Brazil: Goias (US-75615).

Illustrations (Journals): *Revista Brasil. Bot.* (29: 298, Fig.30 (2006)).

Derivation (Clifford & Bostock 2007): L. *-anus*, indicating connection. In honor of Johann Emanuel Pohl (1782–1834) Bohemian botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms 100–150 cm long. Ligule an eciliate membrane. Leaf-blades lanceolate, 10–15 cm long, 5–16 mm wide.

Inflorescence. Synflorescence compound, scanty.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Racemes 2, paired, 2–3 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 2–3 mm

long. Rhachis internodes cuneate, 5 mm long. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, 4 mm long, ciliate, with 2–3 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 7–8 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface deeply depressed. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, 4–5 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.33–0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–18 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central. Mato Grosso, Goias. Mato Grosso, Goiás.

Andropogon polytychos Steud. *Syn. Pl. Gram.* 380. (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960) (as *A. polytychus*, *Dichanthium polytychum*).

TYPE from Sri Lanka. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ceylon.

Illustrations (Books): N.L.Bor, *The grasses of Burma, Ceylon, India and Pakistan* (1960) (92, Fig. 1 as *A. polytychus*).

Derivation (Clifford & Bostock 2007): Gk. *polys*, several; *ptyx*, fold. Origin uncertain.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations flabellate. Culms 30–60 cm long. Ligule an eciliate membrane, 1–2 mm long. Leaf-blades erect, 15–25 cm long, 2–7 mm wide. Leaf-blade surface pilose.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes (1–)2–3(–6), paired or digitate, 4–8 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear. Rhachis internode tip transverse, crateriform, with simple rim. Raceme-bases linear, subequal, 5–15 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate or elliptic, dorsally compressed, 6–7 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, acute, muticous. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or oblong, dorsally compressed, 6–7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally, wingless. Lower glume intercarinal veins distinct, 5 in number. Lower glume surface flat or concave. Lower glume apex acute. Upper glume lanceolate, chartaceous, 1-keeled, wingless. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma linear, hyaline, without keel. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 9–17 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. $2n = 20$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Tropical Asia.
Country /Province /State. Indian Subcontinent, Indo-China. India, Sri Lanka. Myanmar, Thailand. Kerala. Tamilnadu.

Andropogon pringlei Scribn. & Merrill. *U.S. Dept. Agric. Agrost. Bull.* 24: 7. (1901).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: C.G. Pringle 6577, 23 Oct 1896, Mexico: Distrito Federal: Valley of Mexico, dry soil, 8000 ft (US-287863; IT: LE, S-G405).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Cyrus Guernsey Pringle (1838–1911) United States botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short, woody. Culms 100–120 cm long. Lateral branches sparse. Leaf-sheaths pilose. Ligule an eciliate membrane, 1 mm long. Leaf-blades involute, 20–25 cm long, 3 mm wide. Leaf-blade surface pubescent, hairy adaxially.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Racemes 2, paired, 3–6 cm long, bearing 5–10 fertile spikelets on each. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 3 mm long. Rhachis internodes linear, 5–6 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 5–6 mm long, ciliate, with 3 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, comprising 2 subequal glumes without lemmas, linear, 2.5–6 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, acute.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 8–12 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma lanceolate, hyaline, without keel. Lemma margins ciliate. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 17–18 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Central Mexico, Gulf (Mexico), Southwest Mexico, Southeast Mexico.

Distrito Federal, Mexico State, Puebla. Queretaro, Zacatecas. Veracruz. Jalisco, Michoacan, Oaxaca. Chiapas.

Andropogon pseudapricus Stapf. Prain, *Fl. Trop. Afr.* 9: 242 (1918).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Nigeria. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: Barter 936, Nigeria (K).

Illustrations (Books): W. Robyns (1929 and 1934). Flora Agrostologique du Congo Belge et du Ruanda-Urundi, I. Maydees et Andropogonees and II. Panicees. Bruxelles, Goemaere (133, Pl. 10).

Derivation (Clifford & Bostock 2007): Gk. *pseudos*, false. Resembling *Andropogon apricus*.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual, caespitose. Culms geniculately ascending, 50–150 cm long. Ligule an eciliate membrane. Leaf-blades 8–40 cm long, 1–5 mm wide. Leaf-blade surface glabrous.

Inflorescence. Synflorescence compound.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, exerted or embraced at base by subtending leaf. Spatheole linear or lanceolate, 5 cm long. Racemes 2, paired, 2–4 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes oblong or cuneate. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, oblong or cuneate, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas or male, elliptic, dorsally compressed, 4–5 mm long, shorter than fertile. Companion sterile spikelet glumes membranous, glabrous to villous, acute, awned, both glumes awned, with 5–11 mm long awn. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, laterally compressed, 5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface deeply depressed, glabrous. Upper glume linear, chartaceous, 1-keeled. Upper glume awned, 1 -awned, awn 8–16 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 30–50 mm long overall, with twisted column. Column of lemma awn glabrous. Palea oblong.

Flower and Fruit. $n = 20$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. **West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa.** Benin, Burkina, Gambia, Ghana, Guinea-Bissau, Guinea, Ivory Coast, Mali, Nigeria, Senegal, Sierre Leone, Togo. Cameroon, Gabon, DRC. Chad. Tanzania. Malawi.

Andropogon pteropholis W. D. Clayton. *Hook. Ic. Pl.* 7 t. 3644 (1967).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Ghana. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ghana, Gambaga to Bawku: *Rose Innes 30268* (K holo).

Illustrations (Journals): *Hooker's Icones Plantarum* (t.3644 (1967)).

Derivation (Clifford & Bostock 2007): Gk. *pteron*, feather; *pholis*, scale of a snake. Glume keels winged.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms 150–200 cm long, 5–6 -noded. Ligule an eciliate membrane, 1–2 mm long. Leaf-blade base with a false petiole. Leaf-blades 15–25 cm long, 2–8 mm wide. Leaf-blade surface pubescent, hairy on both sides. Leaf-blade apex attenuate, filiform.

Inflorescence. Synflorescence compound, paniculate, 30–40 cm long, lax.

Inflorescence composed of racemes, terminal, subtended by a spatheole. Racemes 2, paired, 4–6 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes clavate, 8 mm long. Rhachis internode tip oblique, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, ciliate, tip lobed (bilobed).

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 8–10 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, acute, awned, both glumes awned, with 6–13 mm long awn. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, acuminate, 11–13 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus oblong, 2 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally, winged on keel, winged all along. Lower glume intercarinal veins distinct, 10 in number. Lower glume surface flat or with a longitudinal median groove. Lower glume apex dentate, 2 -fid, awned, 2 -awned, awn 1–3 mm long. Upper glume lanceolate, chartaceous, 1-keeled, winged on keel, 3 -veined. Upper glume margins ciliate. Upper glume awned, 1 -awned, awn 6 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 9 mm long, hyaline, 3 -veined, ciliate on margins. Fertile lemma lanceolate, 7 mm long, hyaline, without keel. Lemma margins ciliolate. Lemma apex dentate, 2 -fid, incised 0.15 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 30–40 mm long overall, with twisted column. Column of lemma awn glabrous. Palea elliptic, 0.75 length of lemma.

Flower and Fruit. Lodicules 2, cuneate, 1 mm long, fleshy, truncate.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Ghana.

Andropogon pumilus Roxb. *Fl. Ind.* 1: 277. (1820).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India: A native of Coromandel,.

Illustrations (Books): K.M.Matthew, *Illustrations on the Flora of Tamilnadu Carnatic* (1982) (Pl. 802 & 803), G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Fig.1).

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Pl. 11).

Derivation (Clifford & Bostock 2007): L. dwarf, low growing. Habit typically depauperate.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending, 15–45 cm long. Culm-nodes glabrous. Ligule an eciliate membrane. Leaf-blades 7.5–12.5 cm long, 2.5–4 mm wide. Leaf-blade surface glabrous. Leaf-blade apex acuminate.

Inflorescence. Synflorescence compound, paniculate, 4–10 cm long, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 0.5–2 cm long. Racemes 2, paired, deflexed, 1.3–2 cm long. Rhachis tough, deciduous from axis, ciliate on margins. Rhachis internodes cuneate, 2.5 mm long. Rhachis internode tip transverse, crateriform, with simple rim. Raceme-bases flattened, subequal, 1 mm long, shortly lobed (4-lobed), persistent. Spikelets squeezed between internode and pedicel, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, oblong, 2.5 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas or male, lanceolate, dorsally compressed, 3–3.5 mm long, shorter than fertile, persistent. Companion sterile spikelet glumes chartaceous, keeled, 5 -veined, acute, muticous. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, dorsally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume intercarinal veins absent. Lower glume surface deeply depressed. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume mucronate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret linear, 3 mm long, hyaline, 2 -veined. Fertile lemma linear, hyaline, without keel. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–16 mm long overall, with twisted column. Column of lemma awn glabrous. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. Anthers 3, 2 mm long.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent, Indo-China. Myanmar.

Madhya Pradesh, Maharashtra.

Andropogon pungens T.A. Cope. *Kew Bull.*, 50(1): 109 (1995).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Somalia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Somalia, Galguduud: *Herlocker 329* (K holo).

Illustrations (Journals): *Kew Bulletin* (50: 110, Fig.1 (1995)).

Derivation (Clifford & Bostock 2007): callus pungent.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 60–125 cm long. Ligule an eciliate membrane. Leaf-blades flat, 6.5–20 cm long, 1–5.5 mm wide.

Inflorescence. Synflorescence compound, scanty.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Racemes 2, paired, 4.5–7 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs white. Rhachis internodes cuneate. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets squeezed between internode and pedicel, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 5–7 mm long, as long as fertile, persistent. Companion sterile spikelet glumes chartaceous, glabrous, ciliate on margins, acute or acuminate, awned, both glumes awned, with 1.5–4 mm long awn. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, dorsally compressed, 5–8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus linear, 2–3.5 mm long, pilose, base pungent, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface deeply depressed. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, chartaceous, 1-keeled. Upper glume apex acuminate, awned, 1 -awned, awn 3–6 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 40–60 mm long overall, with twisted column. Column of lemma awn puberulous. Palea hyaline, 0 -veined.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa, East Tropical Africa. Somalia. Kenya.

Andropogon pusillus Hook. f. *Journ. Linn. Soc.* 7: 233. (1864).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Cameroon. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Cameroun, Cameroon Mt.: *Mann 2097* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. very small. Plants of small stature.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual, culms solitary or caespitose. Culms geniculately ascending or decumbent, 5–15 cm long. Leaf-sheaths hirsute, with tubercle-based hairs. Ligule an eciliate membrane. Leaf-blades 2–3 cm long, 2–3 mm wide. Leaf-blade surface hirsute. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole lanceolate, 3–4 cm long. Racemes 2, paired, deflexed, 2.5–5 cm long, bearing few fertile spikelets, bearing 2–4 fertile spikelets on each. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes filiform, 3 mm long. Rhachis internode tip transverse, flat, with simple rim. Raceme-bases linear, subequal, 1 mm long, pilose, hairy in axils, persistent. Spikelets

appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, ciliate.

Sterile Spikelets. Basal sterile spikelets well-developed, 2 in number (lower raceme), 0 in upper racemes.

Companion sterile spikelets well-developed, comprising 2 subequal glumes without lemmas or containing empty lemmas, lanceolate, dorsally compressed, 7–8 mm long, longer than fertile, persistent. Companion sterile spikelet glumes chartaceous, keeled, without depressions or pitted (2 pits), dentate, 2 -fid, acute, awned, one glume awned, with 6–8 mm long awn. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base obtuse, attached transversely. Spikelet callus hairs 1–2 mm long.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, chartaceous or herbaceous, 2-keeled, keeled above, keeled laterally. Lower glume primary vein scabrous. Lower glume intercarinal veins distinct, 4–6 in number. Lower glume surface convex or with a longitudinal median groove, pitted (2 pits). Lower glume apex dentate, 2 -fid. Upper glume oblong, chartaceous, 1-keeled, keeled above, 3 -veined. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 3–6 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.33 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 35–45 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa. Nigeria. Cameroon.

Andropogon reinoldii Leon. *Mem. Soc. Poey*, 4: 81 (1922).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Bro. Leon et al.* 9932, 11 Jul 1921–14 Aug 1921, Cuba: Oriente: Sierra Maestra, loma del Gato (cresta) (HAC-405; IT: US-1296094).

Illustrations: None found.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–80 cm long. Leaf-sheaths keeled, glabrous on surface. Ligule an eciliate membrane, 1 mm long. Leaf-blades flat or conduplicate, 10–35 cm long, 2.5–5 mm wide. Leaf-blade surface scabrous, glabrous.

Inflorescence. Synflorescence compound, scanty.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole linear, 4–5 cm long. Peduncle 3–5 cm long. Racemes 2, paired, 2–4 cm long. Rhachis fragile at the nodes, plumose on margins. Rhachis hairs 4–5 mm long. Rhachis internodes filiform, 2.5–3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 2.5–3 mm long, plumose, with 4–5 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -

awned. Principal lemma awn from a sinus, curved or geniculate, 7–8 mm long overall, with a straight or slightly twisted column. Column of lemma awn glabrous.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Bahamas, Cayman Is, Cuba, Dominican Republic, Haiti, Jamaica, Leeward Is, Windward Islands, Puerto Rico.

Andropogon sanlorenzanus T.J. Killeen. *Ann. Missouri Bot. Gard.*, 77(1): 137 (1990).

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *T. Killeen* 2832, 22 Oct 1987, Bolivia: Santa Cruz (ISC; IT: F, LPG, MO, SI, US-3181403).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-anus*, indicating location. From Serania de San Lorenzo, Department of Santa Cruz, Bolivia.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations flabellate. Culms erect, 30 cm long. Leaf-sheaths keeled. Ligule an eciliate membrane. Leaf-blades flat or conduplicate, 6–13 cm long, 2–3 mm wide. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 4–6, digitate, 3–6 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas or male, lanceolate, 5.5–6 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acuminate, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight, 1.5 mm long overall.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

Andropogon scabriglumis Swallen. *Mem. N. Y. Bot. Gard.* 9: 144 (1955).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *W.H. Camp E-3472*, 29–31 May 1945, Ecuador: Chimborazo: Caqon of the Rmo Chanchan, 5000–7000 ft., on open deforested sloped with small patches of scrub in the draws, directly above the village of Huigra (US-2011209).

Illustrations (Books): G.Harling & C.Persson, *Flora of Ecuador* (2006) (78: 196, Fig. 23 (2006)).

Derivation (Clifford & Bostock 2007): L. *scaber*, rough; gluma, husk. Glumes scabrous.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 70–80 cm long. Lateral branches sparse. Leaf-sheaths keeled, glabrous on surface. Ligule an eciliate membrane, 1 mm long. Leaf-blades 18–20 cm long, 4–5 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes. Racemes 2, paired, 3–5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 2 mm long. Rhachis internodes clavate, 4 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the

cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, clavate, 3 mm long, ciliate, with 2 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 7 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, mucronate or awned, one glume awned, with 0.5–1 mm long awn.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume primary vein scabrous. Lower glume intercarinal veins distinct. Lower glume surface flat or concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–18 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Ecuador.

Andropogon schirensis Hochst. *Tent. Fl. Abyss.* 2: 456. (1851).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ethiopia, Shire: *Schimper 1807* (P holo). **Basionym or Replaced Name:** *Andropogon ravus* J. G. Anders., *Bothalia*, 7: 417 (1960). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Schimper 1807*, Ethiopia (P).

Bruxelles, Goemaere (135, Pl. 11), F.N.Hepper, *F.W.T.A.* 3(2) (1972) (487, Fig.454), R.M.Phill, F.T.E.A., *Gramineae* (3(1982):781, Fig 181), G.V.Pope et al., *Flora Zambesiaca* 10.

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Schire Highlands, Ethiopia.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths withering or persistent and investing base of culm, with fibrous dead sheaths. Culms 40–250 cm long. Leaf-sheath auricles absent. Ligule an eciliate membrane, 1–2 mm long. Leaf-blades flat or convolute, 9–70 cm long, 2–12 mm wide.

Inflorescence. Inflorescence composed of racemes, terminal. Racemes 2, paired, unilateral (as to sterile spikelets), 5–25 cm long. Rhachis fragile at the nodes, semiterete, ciliate on margins. Rhachis hairs 1–3 mm long. Rhachis internodes cuneate, 4–5 mm long. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets squeezed between internode and pedicel, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, semiterete, ciliate.

Sterile Spikelets. Basal sterile spikelets well-developed, 2 in number, barren, smaller than fertile. Basal sterile spikelet lemmas awnless.

Companion sterile spikelets well-developed, male, elliptic, dorsally compressed, 5–10 mm long, longer than fertile, persistent. Companion sterile spikelet glumes coriaceous, 13–15 -veined, acute, muticous. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, laterally compressed, 4.5–10 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus cuneate, 1–2 mm long, pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume intercarinal veins

absent. Lower glume surface deeply depressed. Upper glume lanceolate, coriaceous, much thinner above, 1-keeled, keeled above, 1 -veined. Upper glume lateral veins absent. Upper glume margins ciliolate. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 4 mm long, hyaline, 2 -veined. Fertile lemma oblong, 4 mm long, hyaline, without keel, 3 -veined, 0–3 -veined. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 20–40 mm long overall, with twisted column. Column of lemma awn glabrous. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. $n = 10$ (1 ref TROPICOS). $2n = 20$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Illustrations (Journals): *Revista Brasil. Bot.* (29: 298, Fig.31 (2006)).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Friedrich Sellow (1789–1831) German botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 40–110 cm long, 2–3.5 mm diam. Culm-internodes solid. Culm-nodes glabrous. Lateral branches sparse. Leaves mostly basal. Leaf-sheaths keeled, glabrous on surface. Ligule a ciliolate membrane, 0.5–1 mm long. Leaf-blades flat or conduplicate, 20–40 cm long, 3–5 mm wide. Leaf-blade midrib keeled beneath. Leaf-blade apex obtuse, hooded.

Inflorescence. Synflorescence compound, scanty.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Peduncle pilose above. Racemes 3–5, digitate, 3–6 cm long. Rhachis fragile at the nodes, plumose on surface, plumose on margins. Rhachis hairs lengthening towards internode tip, 5–10 mm long. Rhachis internodes linear, 2–2.8 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 3.5–3.8 mm long, plumose, with 5–10 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, linear, 0.6–1.2 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3.5–4 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base obtuse, inserted. Spikelet callus hairs 4–5 mm long.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 2–2.5 mm long, hyaline, 2 -veined, ciliate on margins, fringed above. Fertile lemma lanceolate, 1.5–2 mm long, hyaline, without keel. Lemma apex entire, acuminate, muticous or mucronate. Palea absent or minute.

Flower and Fruit. Anthers 3, 0.6 mm long. Caryopsis linear, 1.7 mm long.

Andropogon sincoranus S.A. Renvoize. *Kew Bull.* 39(1): 181 (1984).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil: Bahia: Barra da Estiva, Harley *et al.* 20765 (HT: CEPEC).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (277, Fig. 105).

Derivation (Clifford & Bostock 2007): L. *-anum*, indicating location. From Serra do Sincora, Brazil.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms erect, slender, 70–100 cm long. Lateral branches sparse. Ligule an eciliate membrane. Leaf-blades 14–35 cm long, 2–3 mm wide. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence composed of racemes. Racemes 2–3, paired or digitate, 5–6 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis internodes linear. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, villous.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas, linear or lanceolate, 5 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, scaberulous, glabrous, acute, muticous. Companion sterile spikelet lemmas 3.5 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave, asperulous. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.33 of lemma length, muticous or awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8–12 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast, Brazil Southeast.

Bahia, Minas Gerais, Rio de Janeiro, Espirito Santo. Bahia. Minas Gerais.

Andropogon tectorum Schum. & Thonn. *Beskr. Guin. Pl.* 49. (1827).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ghana. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Thonning s.n.*, Ghana.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. tectum*, roof. Growing on earth roofs but not exclusively so.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 200–300 cm long, without nodal roots or with prop roots. Ligule an eciliate membrane or a ciliolate membrane, 1–2 mm long. Leaf-blade base tapering to the midrib, with a false petiole. Leaf-blades lanceolate, 30–45 cm long, 10–25 mm wide, flaccid, light green. Leaf-blade apex acuminate.

Inflorescence. Synflorescence compound, paniculate, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole lanceolate, 4–7 cm long, membranous or herbaceous. Racemes 2, paired, 3–4 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 2–3 mm long. Rhachis internodes linear, 3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 3 mm long, ciliate, tip lobed (bilobed).

Sterile Spikelets. Companion sterile spikelets well-developed, male, oblong, dorsally compressed, 4–5 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, acute, mucronate or awned, both glumes awned, with 0.5–1.5 mm long awn. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted. Spikelet callus hairs 1–1.5 mm long.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 1 length of spikelet, membranous, 2-keeled, keeled laterally. Lower glume intercarinal veins distinct. Lower glume surface flat or with a longitudinal median groove. Upper glume lanceolate, membranous, 1-keeled, 3 -veined. Upper glume margins ciliate. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3 mm long, hyaline, 2 -veined, ciliate on margins. Fertile lemma linear, 3 mm long, hyaline, without keel. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–20 mm long overall, with twisted column. Column of lemma awn glabrous. Palea 0.33 length of lemma.

Flower and Fruit. Anthers 3, 2 mm long.

$2n = 20$ (2 refs TROPICOS), or 30 (3 refs TROPICOS).

Derivation (Clifford & Bostock 2007): *L. terni*, three each; -arius, pertaining to. Spikelets occurring to triads.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths glabrous or pilose or villous. Culms erect, 70–120 cm long. Lateral branches ample. Ligule a ciliolate membrane. Leaf-blades flat or conduplicate, 2–4 mm wide.

Inflorescence. Synflorescence compound, linear.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear. Racemes 2, paired, 3–6 cm long. Rhachis fragile at the nodes, plumose on surface, plumose on margins. Rhachis internodes filiform, 6–9 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 4–5 mm long, 0.9 length of fertile spikelet, plumose.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, linear, 1–2 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5–7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined, ciliate on margins. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–25 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. North-central USA, South-central USA, Southeastern USA, Mexico. Iowa, Kansas, Missouri, Oklahoma. Texas. Alabama, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, South Carolina, Tennessee, Virginia. Northeast Mexico. Coahuila.

Andropogon ternatus (Spreng.) Nees. *Agrost. Bras.* 2: 326. (1829).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uruguay. **Basionym or Replaced Name:** *Saccharum ternatum* Spreng., *Syst.* 1: 283 (1825). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Uruguay, Montevideo: Coll?.

Recent Synonyms: *Andropogon macrothrix* Trin., *Mem. Acad. Petersb. Ser.* 6(2) 270 (1833).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (500), L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (1285, Fig. 251 & 1301, Fig. 256), A.Burkat, *Flora Ilustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (500, Fig. 210), A.L.Cabrera, *Flora de la Provincia de Buenos Aires, IV Pt 2 Gramineas* (1970) (593, Fig. 159), B.Rosengurtt, *Gramineas Uruguayas I* (1970) (164, Fig. 64).

Illustrations (Journals): *Revista Brasil. Bot.* (29): 298, Fig.32 (2006).

Derivation (Clifford & Bostock 2007): *L. terni*, three each; -ata, possessing. Spikelets in clusters of three.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations intravaginal. Culms erect, 20–70 cm long, 3–4 -noded. Culm-nodes glabrous. Lateral branches sparse. Leaves mostly basal. Leaf-sheaths 2–9 cm long, glabrous on surface or puberulous. Ligule a ciliolate membrane, 0.4–0.6 mm long, truncate. Leaf-blades 4.5–30 cm long, 2–3.5 mm wide. Leaf-blade surface glabrous or pubescent, hairy adaxially. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 2–4, paired or digitate, 2.5–7 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis hairs 7–8 mm long. Rhachis internodes linear, 0.66 length of fertile spikelet. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 0.75 length of fertile spikelet, villous, with 7–8 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, lanceolate, 2.4–5 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5–6.6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface concave. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous or awned, 1 -awned, awn 0.8–3 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3.8 mm long, hyaline, 2 -veined, ciliate on margins. Fertile lemma lanceolate, 3–4.6 mm long, hyaline, without keel, 1 -veined, 0–3 -veined. Lemma margins ciliate. Lemma apex lobed, 2 -fid, incised 0.33 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 13–22 mm long overall, with twisted column. Column of lemma awn 3.5–7 mm long, glabrous.

Flower and Fruit. Anthers 3, 1.5–2.3 mm long. Caryopsis 2–3 mm long, dark brown.

$2n = 30$ (2 refs TROPICOS).

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America, Brazil, Southern South America. Venezuela. Bolivia. Brazil West Central, Brazil Southeast, Brazil South. Argentina Northeast, Paraguay, Uruguay.

Mato Grosso, Goias, Minas Gerais, Rio de Janeiro, Espirito Santo, Sao Paulo Parana, Catarina, Rio Grande do Sul. Distrito Federal, Mato Grosso, Goiás. Paraná, Rio Grande do Sul, Santa Catarina. Buenos Aires, Cordoba, Corrientes, Entre Rios, Misiones.

Andropogon textilis Rendle. *Cat. Welw. Afr. Pl.* 2: 144. (1899).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Angola. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Angola: Pungo Andongo: common in rather damp meadows between N-billa and Bumba, Mar 1857, *Welwitsch 7440* (LISU holo).

Illustrations (Journals): *Hooker's Icones Plantarum* (t.3088 (1922)).

Derivation (Clifford & Bostock 2007): *L. textilis*, intertwined. Used for weaving or thatching.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–150 cm long. Ligule an eciliate membrane, 5–20 mm long. Leaf-blades 15–40 cm long, 1–5 mm wide.

Inflorescence. Synflorescence compound, open.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Racemes 1, single, 3–5 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis internodes clavate. Rhachis internode tip transverse, crateriform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, clavate, villous.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 6–7 mm long, longer than fertile. Companion sterile spikelet glumes chartaceous, ciliolate on margins, acute, awned, one glume awned, with 1–3 mm long awn. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, laterally compressed, 5–7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface deeply depressed, glabrous or pilose. Upper glume linear, chartaceous, 1-keeled. Upper glume awned, 1 -awned, awn 5–12 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma oblong, hyaline, without keel. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–20 mm long overall, with twisted column. Column of lemma awn glabrous. Palea oblong, 0–2 -veined, without keels.

Distribution (TDWG). Continent. Africa.

Country /Province /State. East Tropical Africa, South Tropical Africa. Tanzania. Angola, Malawi, Zambia, Zimbabwe.

Andropogon thorelii A. Camus. *Bull. Mus. Hist. Nat. Paris*, 26: 561. (1920).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Laos. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Laos: Kemarath (Thorel) Asia Oriental, ?*Thorel s.n.*

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Clovis Thorel (1833–1911) French botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–40 cm long. Culm-internodes distally glabrous. Culm-nodes pubescent. Leaves mostly basal. Leaf-sheaths striately veined, smooth, glabrous on surface. Ligule a ciliolate membrane. Leaf-blades 4–6 cm long, 1.5–2 mm wide. Leaf-blade midrib scarcely raised beneath. Leaf-blade venation indistinct. Leaf-blade surface smooth, glabrous.

Inflorescence. Synflorescence compound, scanty.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear or lanceolate, 7–10 cm long. Racemes 2, paired, 3–3.5 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis hairs 4–5 mm long. Rhachis internodes filiform, 4 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets ascending, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 4.5 mm long, villous, with 4–5 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, linear, 2–3 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear or lanceolate, dorsally compressed, 5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted. Spikelet callus hairs 2.5 mm long.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear or lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled laterally, 5 -veined. Lower glume surface flat. Lower glume apex acute. Upper glume linear, 5 mm long, membranous, 1-keeled. Upper glume apex acute, muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 4.5 mm long, hyaline, 2 -veined. Fertile lemma oblong, 1.5–1.8 mm long, hyaline, without keel. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 12 mm long overall, with twisted column. Column of lemma awn glabrous.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Laos.

Andropogon tracyi Nash. *Bull. N. York Bot. Gard.* 1: 433. (1900).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *S.M. Tracy 3083*, 14 Oct 1895, USA: Mississippi: Lowndes County: Columbus (NY-345592; IT: US-75626 (fragm.)).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (660).

Derivation (Clifford & Bostock 2007): In honour of Samuel Mills Tracy (1847–1920) United States agronomist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–80 cm long. Lateral branches sparse. Leaf-sheaths keeled, smooth, glabrous on surface. Ligule an eciliate membrane. Leaf-blades 10–20 cm long, 1–3 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade apex abruptly acute.

Inflorescence. Synflorescence compound, linear.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf or enclosed. Spatheole lanceolate, 4–5 cm long. Peduncle 1–3 cm long. Racemes 2, paired, 3–4 cm long. Rhachis fragile at the nodes, plumose on margins. Rhachis hairs 6 mm long. Rhachis internodes linear, 2–2.5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 5–6 mm long, plumose, with 6 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels or represented by single glumes, linear, 0–1 mm long, shorter than fertile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4.5–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, cartilaginous, 2-keeled, keeled dorsally. Lower glume primary vein ciliolate. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15–20 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 1.

n = 10 (1 ref TROPICOS).

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA. Alabama, Arkansas, Florida, Georgia, Mississippi, North Carolina, South Carolina.

Andropogon trichozygus Baker. *Journ. Linn. Soc.* 20: 300. (1883).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Central Madagascar., *Baron 1807* (HT: K).

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (267, Fig. 97).

Derivation (Clifford & Bostock 2007): Gk. *thrix*, hairs; *zygos*, yoke. Spikelets in pairs subtended by a ring of hairs.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–100 cm long. Ligule an eciliate membrane. Leaf-blades filiform, 15–30 cm long, 1 mm wide. Leaf-blade surface ribbed.

Inflorescence. Inflorescence composed of racemes. Racemes 2–8, paired or digitate, 5–8 cm long. Rhachis fragile at the nodes, plumose on margins. Rhachis internodes filiform, 2.5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, plumose.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 4 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, glabrous, acute.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, 2-keeled, keeled dorsally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma lanceolate, hyaline, without keel, 0–3 -veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10 mm long overall, with twisted column. Column of lemma awn glabrous.

Flower and Fruit. Anthers 3, 2 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Andropogon tsaratananensis A. Camus. *Bull. Soc. Bot. France*, 72: 591 (1925).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Madagascar, Mt. Tsaratanana: Perrier 16370.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Mt Tsaratanana, Madagascar.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms erect or geniculately ascending, 50–70 cm long. Culm-internodes smooth, distally glabrous. Lateral branches ample. Leaf-sheaths striately veined, glabrous on surface or puberulous. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 1.8–2.5 mm long.

Leaf-blades 12–20 cm long, 2–4 mm wide, stiff. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Synflorescence simple.

Inflorescence composed of racemes. Racemes 2, paired, 5–8 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes cuneate, 3–5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 7–7.5 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, acute, awned, one glume awned, with 2 mm long awn. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted. Spikelet callus hairs 1.5 mm long.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, coriaceous, 2-keeled, keeled dorsally. Lower glume surface deeply depressed. Lower glume margins ciliolate. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, chartaceous, 1-keeled. Upper glume primary vein ciliolate. Upper glume margins ciliolate. Upper glume awned, 1 -awned, awn 2.5 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, hyaline. Fertile lemma oblong, 3.5 mm long, hyaline, without keel. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 12–15 mm long overall, with twisted column. Column of lemma awn glabrous.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Andropogon urbanianus Hitchcock. *Bot. Gaz.* 54: 424. (1912).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Dominican Rep. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *M.D. Fuertes 1420*, Sep 1911, Dominican Republic: Hispaniola I., Barahona Prov.: near Las Salinas, 100 m (US-75628; IT: LE, NY-71020).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Ignatz Urban (1848–1931) German botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 75–150 cm long. Ligule an eciliate membrane. Leaf-blades involute, 30 cm long, 1–2 mm wide.

Inflorescence. Synflorescence compound, paniculate.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole linear, 4–6 cm long. Racemes 2, paired, 2–4 cm long. Rhachis fragile at the nodes, plumose on margins. Rhachis hairs 5 mm long. Rhachis internodes filiform, 3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 3 mm long, plumose, with 5 mm long hairs.

Sterile Spikelets. Companion sterile spikelets well-developed, comprising 2 subequal glumes without lemmas, linear, 2–4 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, glabrous, acuminate, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume linear, membranous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–20 mm long overall, with twisted column. Column of lemma awn glabrous.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Dominican Republic, Haiti.

Andropogon vetus Sohns. *Mem. New York Bot. Gard.* 9(3): 277, f. 12. 1957.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: B. Maguire et al. 30519, 1 Jan 1951, Venezuela: Amazonas (US-2040240).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (24, Fig. 8).

Derivation (Clifford & Bostock 2007): L. old age. Pedicels of sterile florets bearded with abundant long hairs.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 100–400 cm long. Culm-internodes distally glabrous. Leaf-sheaths longer than adjacent culm internode, glabrous on surface. Leaf-sheath auricles erect. Ligule an eciliate membrane, 3–5 mm long. Leaf-blade base tapering to the midrib. Leaf-blades 30–60 cm long, 10–15 mm wide. Leaf-blade surface glabrous. Leaf-blade apex attenuate.

Inflorescence. Synflorescence compound, linear.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole linear. Racemes 1, single, 1–3 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis hairs 1–3 mm long. Rhachis internodes clavate, 2–3.5 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 3.5–3.8 mm long, villous, hairy on margins.

Sterile Spikelets. Companion sterile spikelets well-developed, comprising 2 subequal glumes without lemmas or containing empty lemmas, lanceolate, 2.4–3.4 mm long, separately deciduous. Companion sterile spikelet glumes chartaceous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3.7–5.3 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled laterally, 6 -veined. Lower glume primary vein scaberulous. Lower glume surface flat, glabrous. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2-keeled. Fertile lemma lanceolate, 3–4 mm long, hyaline, without keel, 0–3 -veined. Lemma apex lobed, 2 -fid, with lobes 1 mm long, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–25 mm long overall, with twisted column. Column of lemma awn glabrous. Palea 1.5–2 mm long, hyaline, 2-keeled. Palea keels ciliate.

Flower and Fruit. Lodicules 2, 0.5–0.7 mm long. Anthers 3, 1.5–2 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America. Venezuela, Colombia.

Andropogon virgatus Desv. ex Ham. *Prod. Ind. Occ.* 9 (1825).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from West Indies. **Basionym or Replaced Name:** *Hypogynium virgatum* (Desv. ex Ham.) Dandy, *Journ. Bot.* 64: 54 (1931). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Baudin s.n.*, West Indies (P).

Illustrations (Journals): *Revista Brasil. Bot.* (29: 298, Fig.33–34 (2006)).

Derivation (Clifford & Bostock 2007): *L. virga*, broom; *-ata*, possessing. Inflorescence arms or culms held erect.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Basal innovations flabellate. Culms erect, 60–100 cm long. Ligule a ciliolate membrane. Leaf-blades flat or conduplicate, 10–50 cm long, 2–4 mm wide, stiff.

Inflorescence. Synflorescence compound, fastigiate, 10–40 cm long.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole linear, 0.7–1.5 cm long, herbaceous. Peduncle pubescent above. Racemes 1, single, 6–12 cm long. Rhachis fragile at the nodes, subterete, glabrous on margins. Rhachis internodes linear, 0.5–0.6 mm long. Rhachis internode tip transverse, flat, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 0.5–0.6 mm long, glabrous, tip rectangular.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 2.4–3 mm long, as long as fertile, persistent. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 2.4–3 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus oblong, 0.5 mm long, glabrous, base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, keeled above. Lower glume primary vein scaberulous. Lower glume intercarinal veins absent. Lower glume surface flat. Lower glume apex acute. Upper glume lanceolate, coriaceous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume margins ciliolate. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 1.5 mm long, 0.5 length of spikelet, hyaline, 2 -veined. Fertile lemma linear, 2 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex entire, muticous. Palea absent or minute.

Flower and Fruit. Anthers 3, 0.5–1.3 mm long.

n = 30 (1 ref TROPICOS).

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Virginia, USA.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–100 cm long. Culm-nodes glabrous. Leaf-sheaths keeled, glabrous on surface or hispid, outer margin glabrous or hairy. Ligule a ciliolate membrane. Leaf-blades flat or conduplicate, 10–20 cm long, 2–5 mm wide. Leaf-blade surface glabrous.

Inflorescence. Synflorescence compound, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, embraced at base by subtending leaf. Spatheole lanceolate, 2.5–6 cm long. Racemes 2–5, paired or digitate, sinuous, 2–3 cm long. Rhachis fragile at the nodes, plumose on surface, plumose on margins. Rhachis hairs 5–10 mm long. Rhachis internodes filiform. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, curved, plumose, with 5–10 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 2.5–4 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, membranous, 2-keeled, keeled laterally. Lower glume intercarinal veins absent. Lower glume surface concave. Upper glume lanceolate, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, hyaline. Fertile lemma lanceolate, hyaline, without keel. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight, 10–26 mm long overall. Palea absent or minute.

Flower and Fruit. Anthers 3.

Andropogon vohiboryensis A. Camus. *Bull. Soc. Bot. France*, 78: 9 (1931).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madagascar, Ivohibe: Humbert 3092.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From the Voribory Range, Madagascar.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms erect, 60 cm long. Culm-internodes striate, distally glabrous. Culm-nodes glabrous. Leaf-sheaths striately veined, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane. Leaf-blades 18–20 cm long, 2–5 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scaberulous.

Inflorescence. Synflorescence simple.

Inflorescence composed of racemes. Racemes 2–3, paired or digitate, 2–3 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear, 3 mm long. Rhachis internode tip transverse, cupuliform, with simple rim. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 4.5–5.5 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, acuminate, awned, one glume awned, with 0.7–1 mm long awn. Companion sterile spikelet lemmas enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4.5–5.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, chartaceous, 2-keeled, keeled laterally. Lower glume surface concave. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, chartaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, hyaline, ciliolate on margins. Fertile lemma oblong, 4–4.5 mm long, hyaline, without keel. Lemma margins ciliate, hairy above. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8 mm long overall, with twisted column. Column of lemma awn glabrous.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Andropogon yunnanensis Hack. DC. *Monog. Phan.* 6: 440. (1889).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.M. Delavay 1782*, no date, China: Yunnan: supra Mo-so-yn, prope Lan-Kong (P; IT: US-76243 (fragm. ex W)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Yunnan Province, China.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–60 cm long, 4–5 -noded. Lateral branches sparse. Ligule an eciliate membrane, 1–1.5 mm long, truncate. Leaf-blades 10–14 cm long, 2.5–3.5 mm wide. Leaf-blade surface scaberulous, rough abaxially, glabrous. Leaf-blade margins scabrous.

Inflorescence. Synflorescence compound, scanty.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole. Spatheole linear, 2.5 cm long. Racemes 2, paired, 2–2.5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes clavate, 0.66 length of fertile spikelet. Rhachis internode tip transverse, crateriform, with simple

rim. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, clavate, 0.66 length of fertile spikelet, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 6–7 mm long, as long as fertile. Companion sterile spikelet glumes chartaceous, 7 -veined, glabrous, acute.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear or oblanceolate, dorsally compressed, 6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus oblong, 1 mm long, pubescent, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume linear, 1 length of spikelet, coriaceous, purple, 2-keeled, keeled dorsally. Lower glume intercarinal veins absent. Lower glume surface deeply depressed. Upper glume linear, coriaceous, 1-keeled. Upper glume muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 4–5 mm long, hyaline, 3 -veined, ciliolate on margins, acute. Fertile lemma lanceolate, 4–5 mm long, hyaline, without keel. Lemma apex lobed, 2 -fid, incised 0.25 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8–10 mm long overall, with twisted column. Column of lemma awn glabrous. Palea 0.33 length of lemma, 0 -veined.

Flower and Fruit. Anthers 3, 2.5 mm long.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, Tibet. Sichuan, Yunnan.

Andropterum stolzii (Pilger) C. E. Hubbard. *Mem. N. Y. Bot. Gard.* 9: 112 (1954).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Malawi. **Basionym or Replaced Name:** *Ischaemum stolzii* Pilger, *Engl.Jahrb.* 54: 280 [March] (1917). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *A. Stolz 1248*, 7 May 1912, Africa Oriental: Nyassa Hochland, Station Kyimbila (iso K).

Illustrations (Books): R.M.Phill, F.T.E.A., *Gramineae* (3(1982):753, Fig. 177), G.V.Pope et al., *Flora Zambesiaca* 10 (59:4(2002), T. 22).

Illustrations (Journals): *Hooker's Icones Plantarum* (t.3077 (1922) as *A. variegatum*).

Derivation (Clifford & Bostock 2007): in honor of Adolph Ferdinand Stolz (1871–1917) German missionary in East Africa.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Ischaeminae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, 30–80 cm long, rooting from lower nodes. Ligule a fringe of hairs. Leaf-blades 5–20 cm long, 3–15 mm wide. Leaf-blade surface pubescent. Leaf-blade margins serrulate, ciliate. Leaf-blade apex attenuate, hardened.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 1, single, 4–11 cm long. Rhachis fragile at the nodes, semiterete, ciliate on margins. Rhachis internodes cuneate. Rhachis internode tip transverse, cupuliform. Spikelets squeezed between internode and pedicel, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, cuneate, semiterete, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, oblong, asymmetrical, laterally compressed, 6–10 mm long, longer than fertile, deciduous with the fertile. Companion sterile spikelet glumes cartilaginous, winged on keels (both glumes), distinctly veined, 7 -veined, truncate. Companion sterile spikelet lemmas 2, enclosed by glumes, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5–8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base obtuse, inserted.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, cartilaginous, 2-keeled, wingless. Lower glume primary vein ciliate. Lower glume intercarinal veins absent. Lower glume surface deeply depressed. Lower glume apex acute. Upper glume ovate, cartilaginous, 1-keeled, winged on keel, winged above, 7 -veined. Upper glume apex truncate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret oblong, 4 mm long, hyaline, 3 -veined, acute. Fertile lemma oblong, 4 mm long, hyaline, without keel, 3 -veined, 0–3 -veined.

Lemma apex lobed, 2 -fid, incised 0.33 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8–15 mm long overall, with twisted column. Column of lemma awn glabrous. Palea hyaline, 2 -veined.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, East Tropical Africa, South Tropical Africa. DRC. Tanzania. Malawi, Mozambique, Zambia, Zimbabwe.

TYPE from New Zealand. **Basionym or Replaced Name:** *Agrostis lessoniana* Steud., *Nom. ed.* 2(1) 41 (1840). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Lesson s.n.*, New Zealand (P).

Oryzopsis lessoniana (Steud.) Veldkamp, *Blumea*. 22(1): 11 (1974).

Illustrations (Books): T. Cope & A. Gray, *Grasses of the British Isles* (4).

Images: E.Edgar & H.E.Connor, *Flora of New Zealand* 5, *Gramineae* (2000);, R.Darke, *Ornamental Grasses* (2004);, R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);,

Derivation (Clifford & Bostock 2007): L. -ana, indicating connection. In honor of Reni Primivhre (1794–1849) or his brother Pierre Adolphe Lesson (1805–1888) French botanists.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short, scaly. Culms 100–150 cm long. Culm-internodes smooth, distally glabrous. Lateral branches lacking. Leaf-sheaths outer margin hairy. Ligule an eciliate membrane, 1–1.5 mm long, truncate. Leaf-blades involute, 20–40 cm long, 4–8 mm wide, stiff. Leaf-blade surface smooth or scaberulous, rough adaxially, glabrous. Leaf-blade margins smooth or scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, effuse, 40–75 cm long. Primary panicle branches 5–8 -nate, whorled at most nodes. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2.75–3.25 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, 0.15–0.2 mm long, pubescent, obtuse. Floret callus hairs 0.15–0.2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 2.5–3 mm long, 0.9 length of upper glume, scarious, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.75–3.25 mm long, 1.3 length of adjacent fertile lemma, scarious, 1-keeled, 1(–3) -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex erose, acute, mucronate.

Florets. Fertile lemma lanceolate, laterally compressed, 2.1–2.4 mm long, membranous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute (above only), exposing palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight, 4–9 mm long overall, deciduous. Palea 1.5–1.6 mm long, 0.75 length of lemma, without keels. Palea apex erose.

Flower and Fruit. Lodicules 2, 0.6 mm long. Anthers 1, 1 mm long, yellow, anther tip smooth. Stigmas 2, laterally exerted, plumose. Styles 0 mm long. Caryopsis with adherent pericarp, fusiform, 1.5 mm long. Embryo 0.33 length of caryopsis. Hilum elliptic, 0.15 length of caryopsis.

Distribution (TDWG). Continent. Europe (*), Australasia.

Region. Northern Europe (*).

Country /Province /State. : Great Britain (*). **New Zealand.** New Zealand North I, New Zealand South I.

Aniselytron agrostoides Merrill. *Philipp. Journ. Sci.* 5: 329 (1910).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), J.F.Veldkamp, *Poaceae ms (Flora Malesiana)*.

TYPE from Philippines. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: Merrill 6483, May 1909, Philippines: Luzon: Mt. Pulog, 2400 m (PHN; IT: K, L, W).

Illustrations (Books): C-C Hsu, *Flora of Taiwan*, Vol 5 (1978) (304 as *Aulacolepis agrostoides* var. *formosana*), C-C Hsu, *Taiwan Grasses* (1975) (435, Pl. 1389 as *Aulacolepis agrostoides* var. *formosana*).

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Resembling *Agrostis* in some respect, usually the form of the inflorescence.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms geniculately ascending, slender, 20–40 cm long, 2–3 -noded. Culm-internodes striate, smooth. Culm-nodes black. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode. Ligule an eciliate membrane, 3 mm long, entire or erose, acute. Leaf-blades 10–12 cm long, 3–4 mm wide. Leaf-blade surface smooth. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, equilateral or nodding, 9–13 cm long. Primary panicle branches ascending or spreading, distant, 4–5 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or ovate, laterally compressed, 3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus sparsely hairy, acute.

Glumes. Glumes one the lower absent or obscure or two, persistent, similar, shorter than spikelet, firmer than fertile lemma. Lower glume orbicular, 0.1 mm long, 0.05 length of upper glume, hyaline. Lower glume apex truncate. Upper glume lanceolate, 1.5–2 mm long, 0.4–0.6 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma ovate, 3.5 mm long, 1.5–2 mm wide, membranous, keeled, lightly keeled, 5 -veined, more than 3-veined. Lemma midvein scaberulous. Lemma lateral veins obscure. Lemma apex dentate, 2 -fid, acuminate, mucicous. Palea 1 length of lemma, hyaline, 2 -veined. Palea keels scaberulous. Palea apex acuminate. Rhachilla extension 0.8 mm long, glabrous.

Flower and Fruit. Lodicules 2. Anthers 3, 1.2 mm long. Stigmas 2. Caryopsis with adherent pericarp, 2 mm long. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China, Eastern Asia. Taiwan. Malesia. Philippines.

Aniselytron treutleri (O. Kuntze) J. Sojak. *Cas. Nar. Muz.* (Prague), 148(3–4): 202 (1980).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), J.F.Veldkamp, *Poaceae ms (Flora Malesiana)*, N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960) (as *Aulacolepis treutleri*), T.Koyama, *Grasses of Japan and its neighboring regions* (1987) (as *Aulacolepis treutleri*).

TYPE from India. **Basionym or Replaced Name:** *Milium treutleri* Kuntze, *Rev. Gen.* 780 (1891). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Treutler* 486, 5 Aug 1874, India: Sikkim, Tanglo, 3050 m (K; ILT: CAL, L, W). LT designated by Korthof & Veldkamp, *Gard. Bull. Singapore* 37(2): 216 (1984).

Recent Synonyms: *Calamagrostis treutleri* (Kuntze) U. Shukla, *Grasses N.E. India* 51 (1996). *Aulacolepis treutleri*.

Illustrations (Books): T.Koyama, *Grasses of Japan and its neighbouring regions* (1987) (168, Fig. 58 as *Aulacolepis*), C-C Hsu, *Flora of Taiwan*, Vol 5 (1978) (305 as *Aulacolepis*), C-C Hsu, *Taiwan Grasses* (1975) (436, Pl. 1390 as *Aulacolepis*), H.J.Noltie, *The Grasses of Bhutan* (2000) (611, Fig. 27 as *Calamagrostis*), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 430).

Illustrations (Journals): *Hooker's Icones Plantarum* (t.2396 (1899) as *Deyeuxia*).

Derivation (Clifford & Bostock 2007): in honor of William John Treutler (1841–1915) Indian-born of English parents, physician and plant collector.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, 20–50 cm long. Leaf-sheaths scaberulous. Ligule an eciliate membrane, 2–3 mm long. Leaf-blades 10–25 cm long, 10–15 mm wide. Leaf-blade surface scabrous, rough on both sides. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 15–25 cm long. Primary panicle branches 5–7-nate. Panicle branches capillary, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2.5–2.8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous, obtuse.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 1.5–1.7 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1-veined. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex acute. Upper glume lanceolate, 2–2.4 mm long, 0.8 length of adjacent fertile lemma, membranous, 1-keeled, 1-veined. Upper glume lateral veins absent. Upper glume surface scabrous. Upper glume apex acute.

Florets. Fertile lemma ovate, 2.5–2.8 mm long, cartilaginous, keeled, 5-veined, more than 3-veined. Lemma surface scabrous, rough above. Lemma apex acute. Palea 1 length of lemma, 2-veined. Palea keels approximate. Palea surface asperulous. Rhachilla extension 0.4 length of fertile floret.

Flower and Fruit. Anthers 3, 1.3 mm long.

$2n = 42$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. **China, Eastern Asia.** China South Central, China Southeast. Japan Honshu. Japan, Taiwan. **Indian Subcontinent, Indo-China, Malesia.** Assam, Eastern Himalaya, India. Myanmar, Vietnam. Borneo, Malaya, Singapore, Sumatra.

Fujian, Guangxi, Guizhou, Hubei, Sichuan, Yunnan. Darjeeling, Bhutan, Sikkim.

Anisopogon avenaceus R. Br. *Prod.* 176 (1810).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *R. Brown* 6223, no date, Australia: New South Wales (BM; IT: US-3168441 (fragm. ex BM)).

Illustrations (Books): N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (547, Fig. 108), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (123), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (69, Fig. 10).

Images: K.O.Mallett (ed.). *Flora of Australia*, Vol 44 A (2002) & Vol 44B (2004). *Poaceae*;

Derivation (Clifford & Bostock 2007): *L. -acea*, resembling. With inflorescences and/or spikelets similar to those of *Avena*.

Classification. Subfamily Pooideae. Tribe: Phaenospemateae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–100 cm long. Leaves mostly basal. Ligule a ciliolate membrane, 1.5 mm long. Leaf-blades involute, 10–30 cm long, 1–2 mm wide, coriaceous, stiff. Leaf-blade surface ribbed, scabrous, rough adaxially. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, effuse, nodding, 15–25 cm long. Panicle branches angular, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 40–50 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 4–6 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 40–60 mm long, 1 length of upper glume, herbaceous, without keels, 7–11-veined. Lower glume lateral veins ribbed. Lower glume apex obtuse. Upper glume lanceolate, 40–60 mm long, 2.5–3 length of adjacent fertile lemma, herbaceous, without keels, 7–11-veined. Upper glume lateral veins ribbed. Upper glume apex obtuse.

Florets. Fertile lemma linear, subterete, 12–18 mm long, coriaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins involute, covering most of palea. Lemma apex lobed, 2 -fid, with linear lobes, incised 0.25 of lemma length, awned, 3 -awned. Principal lemma awn from a sinus, geniculate, 60–75 mm long overall, with twisted column. Lateral lemma awns present, arising on inner edge of lobes, wrapped around principal, 25–30 mm long, shorter than principal. Palea 1 length of lemma, scarious, thinner above, 2 -veined. Palea keels approximate. Palea apex dentate, 2 -fid. Rhachilla extension 0.5–1 length of fertile floret.

Flower and Fruit. Lodicules 3, lanceolate, 2.5–3 mm long, membranous, glabrous, acute. Ovary pubescent all over. Caryopsis with tardily free pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Victoria. Coast.

Anomochloa marantoidea Brongn. *Ann. Sc. Nat. Ser. 3*, 16: 369. (1851).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *coll. unknown [presumably received by Mons. Morel from Mons. Porto (of Bahia), and cultivated subsequently]*, 1842, Brazil: Bahia (P; IT: K, US (fragm. ex P)).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (42, Fig. 14), E.J.Judziewicz et al, *American Bamboos* (1999) (323, Fig. 196), R.Pilger, *Die Natürlichen Pflanzenfamilien* 14e (1940) (219, Fig. 7).

Images: E.J.Judziewicz, E.J., *American Bamboos* (1999);, G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012)

(*Smith. Contr. Bot.* No. 68 : 6,7 (1989)).

Derivation (Clifford & Bostock 2007): Gk. *-oidea*, resembling. The leaf-blades resemble those of many Marantaceae.

Classification. Subfamily Anomochlooideae. Tribe Anomochloae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms 50–100 cm long. Leaves mostly basal. Ligule a fringe of hairs, 1–2 mm long. Leaf-blade base cordate, with a false petiole. Leaf-blades lanceolate to oblong, (18–)25–40 cm long, (40–)60–100 mm wide. Leaf-blade venation with distinct cross veins. Leaf-blade apex acute.

Inflorescence. Synflorescence compound, linear (spiciform), 7–14 cm long.

Inflorescence comprising only a few spikelets, comprising 1 fertile spikelets, terminal and axillary, subtended by a spatheole, enclosed. Spatheole lanceolate (enclosing a florescence of 1–5 spikelets, its branches each subtended by 2 bracts), 4.5–9 cm long, herbaceous (with cross-veins). Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 7–15 mm long, tip pyriform.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, curved, laterally compressed, 10–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 3–4 mm long, truncate.

Glumes. Glumes one the lower absent or obscure, deciduous, shorter than spikelet, thinner than fertile lemma. Upper glume lanceolate, 10–15 mm long, 0.5 length of adjacent fertile lemma, herbaceous, without keels, 10–17 -veined. Upper glume lateral veins with cross-veins. Upper glume apex obtuse.

Florets. Fertile lemma ovate, 9–13 mm long, coriaceous, much thinner above, pallid, without keel, 9–15 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute. Lemma apex caudate, with a conical beak (herbaceous, deciduous), with this appendage 13–18 mm long. Palea absent or minute.

Flower and Fruit. Lodicules represented by a ring of hairs. Anthers 4, 3–5 mm long. Stigmas 1, terminally exerted, papillose. Caryopsis with adherent pericarp, oblong, laterally compressed, 10 mm long, apex rostrate. Embryo 0.25 length of caryopsis. Hilum linear, 1 length of caryopsis.

Derivation (Clifford & Bostock 2007): *L. lana*, wool; *-ata*, possessing. Leaf-blades densely pubescent.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Otachyriinae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Culms erect, 60–90 cm long, 1–2 mm diam. Culm-nodes black. Leaves mostly basal. Ligule a ciliolate membrane. Leaf-blades involute, 20–40 cm long, 2–3 mm wide. Leaf-blade surface ribbed.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 8–15 cm long, 1–3 cm wide. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, tip cupuliform.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3.5–4 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume lanceolate, 3.5–4 mm long, membranous, without keels, 5–7 -veined. Upper glume lateral veins ribbed. Upper glume surface villous, hairy on veins. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, linear, 1 length of spikelet, membranous, 5–7 -veined, ribbed, villous, hairy on veins, acute. Fertile lemma ovate, dorsally compressed, 3.5–4 mm long, cartilaginous, much thinner above, much thinner on margins, dark brown, without keel. Lemma margins flat. Lemma apex acute. Palea gaping, 1 length of lemma, cartilaginous.

Flower and Fruit. Anthers 3, 2.5 mm long.

Anthaenantia rufa (Ell.) Schult. *Mant.* 2: 258. (1824).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Anthenantia*).

TYPE from USA. **Basionym or Replaced Name:** *Aulaxanthus rufus* Elliot.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (386), F.W.Gould, *The Grasses of Texas* (1975) (421, Fig. 225).

Derivation (Clifford & Bostock 2007): L. reddish. Inflorescence purple to red.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Otachyriinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short, knotty. Culms 70–110 cm long. Ligule a ciliolate membrane. Leaf-blades erect or ascending, parallel-sided, 5–30 cm long, 3–5 mm wide. Leaf-blade margins scaberulous, glabrous. Leaf-blade apex obtuse or abruptly acute.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 8–16 cm long, 2–3(–5) cm wide. Primary panicle branches ascending or spreading. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 3–4 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume obovate, 3–4 mm long, 1 length of spikelet, membranous, purple, without keels, 5 -veined. Upper glume surface villous. Upper glume hairs dark brown. Upper glume apex obtuse.

Florets. Basal sterile florets 1, male or barren, with palea. Lemma of lower sterile floret obovate, 3–4 mm long, 1 length of spikelet, membranous, 5 -veined, villous, bearing dark brown hairs, bearing hairs 0.6–1 mm long, obtuse. Fertile lemma ovate, 3–4 mm long, cartilaginous, of similar consistency above, much thinner on margins, dark brown, without keel, 3 -veined, 0–3 -veined. Lemma margins flat. Lemma apex acute. Palea gaping, 1 length of lemma, cartilaginous, 2 -veined.

Flower and Fruit. Anthers 3, 2.6–2.8 mm long. Caryopsis with adherent pericarp, orbicular, isodiametric, exposed between gaping lemma and palea at maturity, 1.2–1.4 mm long. Embryo 0.5 length of caryopsis.

Distribution (TDWG). Continent. North America.

Country /Province /State. North-central USA, South-central USA, Southeastern USA. Oklahoma. Texas. Alabama, Florida, Georgia, Mississippi, North Carolina, South Carolina.

Anthaenantia villosa (Michx.) Beauv. *Agrost.* 48. t. 10. f. 7. (1812).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Anthenantia*).

TYPE from USA. **Basionym or Replaced Name:** *Phalaris villosa* Michx., *Fl. Bor. Am.* 1: 43 (1803). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Michaux s.n.*, USA: In sabulosis Carolinae (P).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (386).

Derivation (Clifford & Bostock 2007): L. *villi*, long weak hairs; *-osa*, abundance. The plant in whole or in part covered with long hairs.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Otachyriinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short, scaly. Culms 70–110 cm long. Ligule a ciliolate membrane. Leaf-blades ascending or spreading, tapering towards tip, 5–30 cm long, 5–10 mm wide. Leaf-blade margins scaberulous, tuberculate-ciliate, hairy at base. Leaf-blade apex abruptly acute or acute.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 8–16 cm long, 1–2 cm wide. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 3–4 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume obovate, 3–4 mm long, 1 length of spikelet, membranous, mid-green, without keels, 5 -veined. Upper glume surface villous. Upper glume hairs white. Upper glume apex obtuse.

Florets. Basal sterile florets 1, male or barren, with palea. Lemma of lower sterile floret obovate, 3–4 mm long, 1 length of spikelet, membranous, 5 -veined, villous, bearing white hairs, bearing hairs 0.3–0.5 mm long, obtuse. Fertile lemma ovate, 3–4 mm long, cartilaginous, of similar consistency above, much thinner on margins, dark brown, without keel, 3 -veined, 0–3 -veined. Lemma margins flat. Lemma apex acute. Palea gaping, 1 length of lemma, cartilaginous, 2 -veined.

Flower and Fruit. Anthers 3, 2.6–2.8 mm long. Caryopsis with adherent pericarp, orbicular, isodiametric, exposed between gaping lemma and palea at maturity, 1.2–1.4 mm long. Embryo 0.5 length of caryopsis.

Illustrations (Books): R.McVaugh, *Flora Nova-Galiciana* Vol.14 *Gramineae* (1983) (as *Leptocoryphium*).

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Otachyriinae.

Habit, Vegetative Morphology. Perennial, culms solitary. Rhizomes elongated, scaly. Butt sheaths withering. Culms erect, 60–100 cm long. Leaf-sheaths outer margin hairy. Ligule a ciliolate membrane, 0.5 mm long. Leaf-blades 10–30 cm long, 6–10 mm wide. Leaf-blade surface glabrous or pilose. Leaf-blade margins scaberulous, tuberculate-ciliate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 20–30 cm long, 20–30 cm wide. Primary panicle branches 5–10 in number, ascending, 6–13 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, clavate, flexuous, 1–8 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, acute, 3–4 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure or two, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 0.5–0.7 mm long, 0.15 length of upper glume, hyaline. Upper glume lanceolate, 3–4 mm long, 1 length of spikelet, membranous, without keels, 3(–5) -veined. Upper glume surface pilose, hairy between veins. Upper glume hairs 1 mm long. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, lanceolate, 1 length of spikelet, membranous, 3(–5) -veined, pilose, hairy between veins, bearing hairs 1 mm long, acute. Fertile lemma ovate, dorsally compressed, 3–4 mm long, cartilaginous, much thinner above, much thinner on margins, dark brown, without keel. Lemma lateral veins obscure. Lemma margins flat, ciliolate. Lemma apex acute. Palea gaping, 1 length of lemma, cartilaginous.

Flower and Fruit. Anthers 3, 2–2.5 mm long.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Southwest Mexico.

Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (261), E.G.Nicora, *Los Generos de Gramineas de America Austral* (1987) (446, Fig. 157), F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (18, Fig. 2), R.Pilger, *Die Natürlichen Pflanzenfamilien* 14e (1940) (42, Fig. 22).

Illustrations (Journals): *Systematic Botany* (18: 444, Fig.5 (1993)).

Derivation (Clifford & Bostock 2007): in honor of Karl Fiebrig Gertz (1869–1951) German-born South American botanist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect, 65–150 cm long. Culm-internodes elliptical in section, 20–30 cm long, distally glabrous. Culm-nodes brown, glabrous. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths 12–27 cm long, glabrous on surface to pubescent, outer margin glabrous or hairy. Ligule an eciliate membrane, 0.3–1.2 mm long. Leaf-blades linear or lanceolate, 9–45 cm long, 5–10 mm wide. Leaf-blade surface glabrous or pilose, sparsely hairy, hairy adaxially. Leaf-blade margins scabrous. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Peduncle 20–60 cm long, glabrous. Racemes 12, borne along a central axis, distant, erect, unilateral, 1–6.5 cm long. Central inflorescence axis 15–27 cm long, hirsute. Rhachis semiterete, hirsute on surface. Spikelet packing crowded. Spikelets in pairs or in threes. Fertile spikelets pedicelled. Pedicels present, clavate, angular, unequal, ciliate.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, compressed slightly, 3–3.6 mm long, 1.2 mm wide, falling entire.

Glumes. Glumes shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 0.3–1 mm long, 0.1–0.33 length of spikelet, hyaline, 0 -veined. Lower glume lateral veins absent. Lower glume surface hirsute. Upper glume oblong, 2.6–2.8 mm long, 0.9–0.95 length of spikelet, membranous, without keels, 5–7 -veined. Upper glume lateral veins ribbed. Upper glume surface hirsute, with tubercle-based hairs. Upper glume margins ciliate. Upper glume apex obtuse or acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, oblong, 2.8–3.3 mm long, 1 length of spikelet, membranous, 5–7 -veined, ribbed, hirsute. Palea of lower sterile floret 3–3.3 mm long, 1 length of lemma. Fertile lemma elliptic, 2.9–3.3 mm long, 1 mm wide, coriaceous, yellow, shiny, without keel, more than 3-veined. Lemma margins involute. Lemma apex acute, papillose or pubescent. Palea gaping, 1 length of lemma, coriaceous.

Flower and Fruit. Lodicules 2, 0.3 mm long, truncate. Anthers 3, 2.3–2.4 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil, Southern South America. Bolivia. Argentina Northwest, Paraguay.

Jujuy.

Anthaenantiopsis perforata (Nees) L. Parodi. *Not. Mus. La Plata, Bot.*, 8: 91 (1943).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Brazil. **Basionym or Replaced Name:** *Panicum perforatum* Nees, *Agrost. Bras.* 126 (1829). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *F. Sellow s.n.*, [mis.?] de Schlechtendal, 1829, Brasilia (LE-TRIN-0881.02 (& fig.)).

Illustrations (Books): F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (21, Fig. 2).

Illustrations (Journals): *Systematic Botany* (18: 446 (1993), Fig.6 as var. *perforata*, 447, Fig.7 as var. *camporum* (1993)).

Derivation (Clifford & Bostock 2007): L. *per*, very; *forum*, open-space; *-ata*, possessing. With the rhachis bearing an oblong perforation.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect, 17–95 cm long. Culm-internodes terete, 15–17 cm long, distally glabrous or hirsute. Culm-nodes pubescent. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths 6–10.5 cm long, mostly shorter than adjacent culm internode, hirsute to hispid. Ligule an eciliate membrane, 0.3–0.7 mm long, truncate. Collar pilose. Leaf-blades linear or lanceolate, 4–22 cm long, 3–8 mm wide. Leaf-blade midrib conspicuous. Leaf-blade surface hirsute. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Peduncle hispid above. Racemes 7, borne along a central axis, closely spaced, in a multilateral false spike, erect, unilateral, 1–2.5 cm long. Central inflorescence axis 3.5–10 cm long, hirsute. Rhachis semiterete, hirsute on surface. Spikelet packing contiguous. Spikelets solitary or in pairs. Fertile spikelets pedicelled. Pedicels present, linear, angular, unequal, ciliate.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, compressed slightly, 2.7–3.6 mm long, 1.1–1.5 mm wide, falling entire.

Glumes. Glumes shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 0.3–1.2 mm long, 0.1–0.33 length of spikelet, hyaline, 0–1 -veined. Lower glume lateral veins absent. Lower glume surface hirsute. Upper glume oblong, 2.7–3.3 mm long, 0.9–0.95 length of spikelet, membranous, without keels, 5–7 -veined. Upper glume lateral veins ribbed. Upper glume surface hirsute. Upper glume margins ciliate. Upper glume apex obtuse or acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, oblong, 2.7–3 mm long, 1 length of spikelet, membranous, 5–7 -veined, ribbed, hirsute. Palea of lower sterile floret 2.4–3.1 mm long, 1 length of lemma. Fertile lemma elliptic, 2.4–3 mm long, 1–1.3 mm wide, coriaceous, yellow, without keel, more than 3-veined. Lemma surface papillose. Lemma margins involute. Lemma apex acute, scabrous or pubescent. Palea gaping, 1 length of lemma, coriaceous.

Flower and Fruit. Lodicules 2, 0.4 mm long, truncate. Anthers 3, 2 mm long, purple.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil, Southern South America. Bolivia. Brazil West Central. Paraguay.

Mato Grosso, Goiás. Distrito Federal, Mato Grosso, Goiás.

Anthaenantiopsis rojasiana L. Parodi. *Not. Mus. La Plata, Bot.*, 8: 87 (1943).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Paraguay. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *T. Rojas* 6290, 6 Sep 1933, Paraguay: Amambay: Pedro Juan Caballero, estero Ypayere, 22: 33'S 55: 45'W (BAA).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (261), F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (23, Fig. 4).

Illustrations (Journals): *Systematic Botany* (18: 448, Fig.8 (1993)).

Derivation (Clifford & Bostock 2007): L. -ana, indicating connection. In honor of Teodoro Rojas (1877–1954) Paraguayan botanist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 100–110 cm long, 3 -noded. Culm-nodes glabrous. Leaf-sheaths pubescent. Ligule a fringe of hairs. Leaf-blades 25–35 cm long, 5–7 mm wide. Leaf-blade surface pubescent, hairy adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 6–30, borne along a central axis, closely spaced, in a multilateral false spike, unilateral, 1–3 cm long. Central inflorescence axis 10–15 cm long. Rhachis angular, glabrous on margins. Spikelet packing contiguous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, unequal, 1–3 mm long, ciliate, hairy at tip.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, compressed slightly, obtuse, 3–3.5 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets or shorter than spikelet, thinner than fertile lemma. Upper glume oblong, membranous, without keels, 5–7 -veined. Upper glume lateral veins ribbed. Upper glume surface pilose or villous, hairy above. Upper glume margins ciliate. Upper glume apex obtuse.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, oblong, 1 length of spikelet, membranous, 5 -veined, ribbed, pilose or villous, hairy above, obtuse. Palea of lower sterile floret 1 length of lemma (with pubescent apex). Fertile lemma oblong, 3–3.5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma margins involute. Lemma apex acute, pubescent. Palea gaping, 1 length of lemma, coriaceous, 2 -veined.

Flower and Fruit. Anthers 3, 2 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Paraguay.

Corrientes, Misiones.

***Anthaenantiopsis trachystachya* (Nees) Mez. *Engl. Jahrb.* 56 *Beibl.* 125, 11 (1921).**

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Brazil. **Basionym or Replaced Name:** *Panicum trachystachyum* Nees, *Agrost. Bras.* 125. (1829). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: NT: *F. Sellow 1243*, Brazil: without further locality (B; INT: US-1063676). NT designated by Morrone et al., *Syst. Bot.* 18: 450 (1993). INT: *F. Sellow s.n.*, Brazil (US-1063676, US-81146).

Illustrations (Books): F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (26, Fig. 5).

Illustrations (Journals): *Systematic Botany* (18: 451, Fig.8 (1993)).

Derivation (Clifford & Bostock 2007): Gk *trachys*, rough; *stachys*, spike as of an ear of wheat. Glumes rough.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Culms 60–80 cm long. Ligule an eciliate membrane. Leaf-blades convolute, 5–30 cm long, 2–4 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 4–7, borne along a central axis, unilateral, 1–2 cm long. Central inflorescence axis 7–10 cm long. Rhachis angular, ciliate on margins. Spikelet packing lax. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, linear or oblong, unequal, ciliate.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, compressed slightly, obtuse, 3 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure or two, dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 0–1.5 mm long, 0–0.5 length of spikelet, hyaline, without keels, 0 -veined. Lower glume lateral veins absent. Lower glume surface villous. Upper glume ovate, membranous, without keels, 5 -veined. Upper glume lateral veins ribbed. Upper glume surface villous. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, 5 -veined, ribbed, villous, bearing hairs 0.5–1 mm long, acute. Fertile lemma ovate, 3 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma margins involute. Lemma apex acute, pubescent. Palea gaping, 1 length of lemma, coriaceous, 2 -veined.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil, Southern South America. Bolivia. Brazil West Central, Brazil South. Paraguay.

Mato Grosso, Goiás, Sao Paulo Parana. Mato Grosso, Goiás. Paraná.

***Antheophora ampullacea* Stapf & G. E. Hubbard. *Prain, Fl. Trop. Afr.* 9: 939 (1930).**

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Nigeria. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Upper Guinea: Northern Nigeria: Aboh, *Barter 463*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. ampulla*, flask; **-acea**, indicating resemblance. Spikelets flask-shaped.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Anthephorinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 50–100 cm long. Ligule an eciliate membrane, 2–3 mm long. Leaf-blades 10–20 cm long, 2–5 mm wide. Leaf-blade margins cartilaginous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 8–17 cm long. Primary panicle branches accrescent to a central axis, with sessile scars on axis. Panicle axis angular, smooth, bearing deciduous spikelet clusters. Spikelets subtended by an involucre. Fertile spikelets sessile, 6–9 in the cluster. Companion sterile spikelets sessile, 6–9 in the cluster. Involucre composed of imperfect spikelets, oblong, 4–5 mm long, base obtuse, base glabrous.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, lanceolate, 4–5 mm long, longer than fertile, deciduous with the fertile. Companion sterile spikelet glumes free, coriaceous, thicker on margins (cartilaginous as seen from inside), 7–11 -veined, scabrous, glabrous, acute or acuminate, muticous or awned, with 0–4 mm long awn.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3–4 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume subulate, 1 length of spikelet.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 1 length of spikelet, membranous, 5–7 -veined, puberulous, eciliate on margins, obtuse. Fertile lemma lanceolate, 3–5 mm long, cartilaginous, much thinner on margins, without keel, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma surface asperulous (above). Lemma margins flat, covering most of palea. Lemma apex acuminate. Palea cartilaginous, 1-keeled.

Flower and Fruit. Anthers 3, 2 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, South Tropical Africa. Nigeria. DRC. Angola.

Anthephora argentea Goossens. *Trans. Roy. Soc. S. Afr.* 20: 198 (1932).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Cape Province...Hay dist. near Dunmurry, on sides of kloof, *Wilmann 2203*.

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): *L. silvery*. Glumes or lemmas silvery.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Anthephorinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 40–90 cm long. Leaf-sheaths wider than blade at the collar. Ligule an eciliate membrane, 4–8 mm long. Leaf-blades tapering towards sheath, conduplicate, 10–15 cm long, 1–2 mm wide, stiff. Leaf-blade surface ribbed. Leaf-blade margins unthickened.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 7–13 cm long. Primary panicle branches accrescent to a central axis, with sessile scars on axis. Panicle axis angular, bearing deciduous spikelet clusters. Spikelets subtended by an involucre. Fertile spikelets sessile, 3–4 in the cluster. Companion sterile spikelets sessile, 3–4 in the cluster. Involucre composed of imperfect spikelets, oblong, 6–8 mm long, base bluntly stipitate, base villous.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, elliptic, 5–7 mm long, longer than fertile, deciduous with the fertile. Companion sterile spikelet glumes free, coriaceous, 3–4 -veined, villous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5–7 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes one the lower absent or obscure, shorter than spikelet, thinner than fertile lemma. Upper glume subulate, 0.75–0.8 length of spikelet. Upper glume margins ciliolate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 1 length of spikelet, membranous, villous, hairy above, acute. Fertile lemma lanceolate, 4–6 mm long, cartilaginous, much thinner on margins, without keel. Lemma margins flat, covering most of palea. Lemma apex acute. Palea cartilaginous, 1-keeled.

Flower and Fruit. Anthers 3.

$2n = 9$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Namibia, Botswana, North-West, Northern Cape.

Antheophora cristata (Doell) Hack. ex Wildem. & Th. Dur. *Reliq. Dewevre.* :255 (1901).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Antheophora elegans* var. *cristata* Doell, *Fl. Bras.* 2,2:314 (1878). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: T: *Anon. s.n.*, no date, Brazil: Pernambuco (US-865420 (fragm. ex hb. Doll)). HT: *Forsell s.n.*, Brazil (KR).

Illustrations (Books): W. Robyns (1929 and 1934). *Flora Agrostologique du Congo Belge et du Ruanda-Urundi*, I. Maydees et Andropogonees and II. Panicees. Bruxelles, Goemaere (323, Pl. 49).

Derivation (Clifford & Bostock 2007): L. crested. Inflorescence forming a crest.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Anthephorinae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending or decumbent, 50–100 cm long, without nodal roots or rooting from lower nodes. Leaf-sheaths glabrous on surface or hirsute. Ligule an eciliate membrane, 2–3 mm long. Leaf-blades tapering towards tip, 5–10 cm long, 3–8 mm wide. Leaf-blade surface glabrous or pilose. Leaf-blade margins cartilaginous, crenate.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 2.5–8 cm long. Primary panicle branches accrescent to a central axis, with sessile scars on axis. Panicle axis angular, scaberulous, bearing deciduous spikelet clusters. Spikelets subtended by an involucre. Fertile spikelets sessile, 3–8 in the cluster. Companion sterile spikelets sessile, 3–8 in the cluster. Involucre composed of imperfect spikelets, connate into a disc below (3–4mm diam), cuneate (conical), 3.5–6 mm long, base obtuse, base glabrous.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, ovate, 3.5–6 mm long, longer than fertile, deciduous with the fertile. Companion sterile spikelet glumes united below, coriaceous, thinner on margins, 7–15 -veined, scaberulous, glabrous, obtuse or acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3–4 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes one the lower absent or obscure, shorter than spikelet, thinner than fertile lemma. Upper glume subulate, 0.5–0.75 length of spikelet. Upper glume margins ciliolate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret ovate, 1 length of spikelet, membranous, 7–9 -veined, scaberulous, puberulous, ciliolate on margins, acute or acuminate. Fertile lemma lanceolate, 3–4 mm long, cartilaginous, much thinner on margins, without keel. Lemma margins flat, covering most of palea. Lemma apex acute. Palea cartilaginous, 1-keeled.

Flower and Fruit. Anthers 3, 2 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, South Tropical Africa. Benin, Ghana, Guinea, Ivory Coast, Nigeria. Cabinda, Gabon, Annobon, Principe & Sao Tome, DRC. Angola (*).

Anthehora elongata Wildem. *Ann. Mus. Congo, Ser. 4, 2.* (1902).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from DRC. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Lukafu, fevrier, *Ct. Verdick*, 413.

Derivation (Clifford & Bostock 2007): *L. elongata*. Inflorescence elongated.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Anthephorinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 50–100 cm long. Ligule an eciliate membrane, 2–3 mm long. Leaf-blades 10–40 cm long, 2–7(–12) mm wide. Leaf-blade margins cartilaginous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 8–20 cm long. Primary panicle branches accrescent to a central axis, with sessile scars on axis. Panicle axis angular, scaberulous, bearing deciduous spikelet clusters. Spikelets subtended by an involucre. Fertile spikelets sessile, 6–9 in the cluster. Companion sterile spikelets sessile, 6–9 in the cluster. Involucre composed of imperfect spikelets, oblong, 5–6 mm long, base obtuse, base glabrous.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, lanceolate, 5–6 mm long, shorter than fertile, deciduous with the fertile. Companion sterile spikelet glumes free, coriaceous, thicker on margins (cartilaginous as seen from inside), 7–11 -veined, scabrous, glabrous, setaceously acuminate, muticous or awned, with 0–4 mm long awn.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 6–7 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume subulate, 1 length of spikelet.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 1 length of spikelet, membranous, 5–7 -veined, puberulous, eciliate on margins or ciliate on margins (above), acute. Fertile lemma lanceolate, 6–7 mm long, cartilaginous, much thinner on margins, without keel, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma surface asperulous, rough above. Lemma margins flat, covering most of palea. Lemma apex acuminate. Palea cartilaginous, 1-keeled.

Flower and Fruit. Anthers 3, 3–3.5 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, East Tropical Africa, South Tropical Africa. DRC. Tanzania. Angola, Malawi, Zambia.

TYPE from Jamaica. **Basionym or Replaced Name:** *Tripsacum hermaphroditum* L., *Syst. ed.* 10: 1261 (1759). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Browne s.n.*, Jamaica (LINN-1097.2). LT designated by Davidse in Cafferty et al., *Taxon* 49(2): 257 (2000).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 25 Poaceae*, part 2 (2003) (538), A.S.Hitchcock, *Manual of the Grasses of the West Indies* (1936) (100, Fig. 58), S.A.Renvoize, *The Grasses of Bahia*, 1984 (260, Fig. 97), J.A.Steyermark et al, *Flora of the Venezuelan Guayana Vol. 8* (2004) (27, Fig. 10), G.Harling & C.Persson, *Flora of Ecuador* (2006) (78: 164, Fig. 19 (2006)), E.Judziwicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (44, Fig. 3).

Illustrations (Journals): *Ruizia* (13:416 Fig 55e-f (1993)).

Derivation (Clifford & Bostock 2007): L. bisexual. Spikelets each with a single bisexual floret.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Anthephorinae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending or decumbent, 20–80 cm long, without nodal roots or rooting from lower nodes. Ligule an eciliate membrane, 1.5–2.5 mm long. Leaf-blades 2.5–17 cm long, 4–7 mm wide. Leaf-blade surface glabrous or hispid. Leaf-blade apex acute or acuminate.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 3.5–10 cm long. Primary panicle branches accrescent to a central axis, with sessile scars on axis. Panicle axis angular, bearing deciduous spikelet clusters. Spikelets subtended by an involucre. Fertile spikelets sessile, 2 in the cluster. Companion sterile spikelets sessile, 4 in the cluster. Involucre composed of imperfect spikelets, connate into a cup below, oblong, 6–9 mm long, base obtuse.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, ovate, 6–9 mm long, longer than fertile, deciduous with the fertile. Companion sterile spikelet glumes united below, coriaceous, glabrous, acuminate, mucous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, 3.5–4.5 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes one the lower absent or obscure, shorter than spikelet, thinner than fertile lemma. Upper glume subulate, 1.7–4.2 mm long, 0.5–0.9 length of spikelet.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret ovate, 1 length of spikelet, membranous, 7 -veined, scabrous, glabrous, acute. Fertile lemma ovate, 3.7–4 mm long, cartilaginous, much thinner on margins, without keel, 3 -veined, 0–3 -veined. Lemma margins flat, covering most of palea. Lemma apex acute. Palea cartilaginous, 1-keeled.

Flower and Fruit. Anthers 3.

$2n = 18$ (1 ref TROPICOS).

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Hawaii (*). **Southeastern USA, Mexico.** Florida (*). Central Mexico, Gulf (Mexico), Northwest Mexico, Southwest Mexico, Southeast Mexico. **Mesoamerica, Caribbean, Northern South America, Western South America, Brazil.** Belize, Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, Panama. Anthephora laevis Stapf & C. E. Hubbard. Prain, *Fl. Trop. Afr.* 9: 937 (1930).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Eritrea. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Eritrea, Saati: *Schweinfurth 324* (K holo).

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 420), S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (282, Fig 112).

Derivation (Clifford & Bostock 2007): L. smooth. Lacking hairs or roughness, usually of leaf-blades or lemmas.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Anthephorinae.

Habit, Vegetative Morphology. Perennial. Culms erect or geniculately ascending, 20–40 cm long, 2–5 -noded. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1–2 mm long. Leaf-blades 4–8 cm long, 2–4 mm wide, glaucous. Leaf-blade surface glabrous. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 4–8 cm long. Primary panicle branches accrescent to a central axis, with sessile scars on axis. Panicle axis angular, glabrous, bearing deciduous spikelet clusters. Spikelets subtended by an involucre. Fertile spikelets sessile, 4–5 in the cluster.

Companion sterile spikelets sessile, 4–5 in the cluster. Involucre composed of imperfect spikelets, oblong, 3.5–4.5 mm long, base obtuse, base pubescent.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, elliptic or oblong, 3.5–4.5 mm long, as long as fertile, deciduous with the fertile. Companion sterile spikelet glumes free, coriaceous, 4–6 -veined, smooth, glabrous, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3.5–4.5 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes one the lower absent or obscure, shorter than spikelet, thinner than fertile lemma. Upper glume subulate, 2–3 mm long, hyaline, 1 -veined. Upper glume margins ciliolate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret linear or oblong, 3.5–4 mm long, 1 length of spikelet, membranous, 3 -veined, pubescent, acute. Fertile lemma linear or lanceolate, 3.5–4.5 mm long, chartaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins flat, covering most of palea. Lemma apex acute. Palea 1 length of lemma, chartaceous, 1-keeled.

Flower and Fruit. Anthers 3, 3 mm long. Caryopsis 1 mm long.

Distribution (TDWG). Continent. Africa, Temperate Asia.

Country /Province /State. Northeast Tropical Africa. Eritrea, Sudan. Western Asia. Palestine, Israel & Jordan.

Anthehora nigritana Stapf & C. E. Hubbard. Prain, *Fl. Trop. Afr.* 9: 937 (1930).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Nigeria. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Nigeria, Nupe: *Barter 1380* (K syn); Nigeria, Katagum district: *Dalziel 260* (K syn);

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating location. From the Niger region of Upper Guinea.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Anthephorinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Butt sheaths villous. Culms erect or geniculately ascending, 50–150 cm long. Leaf-sheath auricles absent or erect. Ligule an eciliate membrane, 1–7 mm long. Leaf-blades 10–40 cm long, 3–8 mm wide.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 10–24 cm long. Primary panicle branches accrescent to a central axis, with sessile scars on axis. Panicle axis angular, scaberulous, bearing deciduous spikelet clusters. Spikelets subtended by an involucre. Fertile spikelets sessile, 6–9 in the cluster. Companion sterile spikelets sessile, 6–9 in the cluster. Involucre composed of imperfect spikelets, oblong, 4–6 mm long, base obtuse, base pubescent.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, elliptic, 4–6 mm long, as long as fertile, deciduous with the fertile. Companion sterile spikelet glumes free, coriaceous, thinner on margins, 3–7 -veined, pubescent, acute, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4–6 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume subulate, 1 length of spikelet. Upper glume margins ciliolate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 1 length of spikelet, membranous, 5–7 -veined, scaberulous, glabrous, ciliolate on margins, bearing hairs 0.2–0.5 mm long, obtuse. Fertile lemma lanceolate, 4–6 mm long, cartilaginous, much thinner on margins, without keel, 3 -veined, 0–3 -veined. Lemma margins flat, covering most of palea. Lemma apex obtuse or acute. Palea cartilaginous, 1-keeled.

Flower and Fruit. Anthers 3, 1.5–3 mm long.

Distribution (TDWG). Continent. Africa, Temperate Asia.

Country /Province /State. West Tropical Africa, Northeast Tropical Africa, East Tropical Africa. Mali, Nigeria, Niger, Eritrea, Somalia, Sudan, Kenya. **Arabian Peninsula.** Saudi Arabia, Yemen.

Anthehora pubescens Nees. *Fl. Afr. Austr.* 74. (1841).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. **Basionym or Replaced Name:** *Anthehora hochstetteri* Nees, *Flora*, 27: 249. (1844). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: South Africa, Gariep to Lauwwaterskloof: *Lichtenstein* 569 (B holo).

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (437 & 439 , Fig. 362 & 364 as *A. ramosa*), M.A.N.Muller, *Grasses of South West Africa/Namibia* (1984) (& as *A. ramosa*), G.E.Gibbs Russell et al, *Grasses of Southern Africa* (1990) (42, Fig. 17), S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (282, Fig. 112), T.A.Cope, in M.Thulin, *Poaceae* (Gramineae). *Flora of Somalia* (1995) (248, Fig. 144), R.Pilger, *Die Natürlichen Pflanzenfamilien* 14e (1940) (101, Fig. 61).

Images: E.Edgar & H.E.Connor, *Flora of New Zealand* 5, *Gramineae* (2000); (as *A. ramosa*), F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): *L. pubesco*, become hairy. Plant whole or in part hairy.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Anthephorinae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Culms erect or geniculately ascending, 30–100 cm long. Leaf-sheath auricles absent or erect. Ligule an eciliate membrane, 2–8 mm long. Leaf-blades 3–40 cm long, 2–6 mm wide. Leaf-blade margins cartilaginous, crenate.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 5–25 cm long. Primary panicle branches accrescent to a central axis, with sessile scars on axis. Panicle axis angular, bearing deciduous spikelet clusters. Spikelets subtended by an involucre. Fertile spikelets sessile, 4–10 in the cluster. Companion sterile spikelets sessile, 4–10 in the cluster. Involucre composed of imperfect spikelets, oblong, 6–11 mm long, base obtuse, base pubescent.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, lanceolate, 6–11 mm long, as long as fertile, deciduous with the fertile. Companion sterile spikelet glumes free, coriaceous, 3–7 -veined, pilose to villous, acute or acuminate or setaceously acuminate, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3–7 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume subulate, 3–6 mm long. Upper glume margins ciliate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 4–6 mm long, 1 length of spikelet, hyaline, 3–7 -veined, puberulous, ciliate on margins, bearing hairs 1 mm long, acute. Fertile lemma lanceolate, 4–6 mm long, cartilaginous, much thinner on margins, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous (above). Lemma margins flat, covering most of palea. Lemma apex acute. Palea cartilaginous, 1-keeled.

Flower and Fruit. $2n = 36$ (1 ref TROPICOS).

Distribution (TDWG). **Continent.** Africa, Temperate Asia.
